

Useful outcomes from CS405:

(i) better understanding of why the conflation of conventional phases of development (requirements, specification, design, use, testing) can be beneficial, and gaining experience of one way this can be practically supported;

(ii) better appreciation of the need, and technical potential, for much greater integration of human processing with automated processing;

(iii) appreciation of a broad theoretical framework that offers support for the practical approach indicated in (i) and (ii);

(iv) opportunity for experience of a sustained coursework in 'exploratory modelling' to construct an artefact and presentation in a conference-style.
