ENabling Humanitarian Attributes for Nurturing Community-based Engineering

(project No: 598502-EPP-1-2018-1-UK-EPPKA2-CBHE-JP (2018-2582/001-001))

Hi, my name is Andrew Ng and I'm one of the enhance project team for Institute Technology Bandung, Indonesia. I'm a master degree student with major in construction engineering and management within the Faculty of Civil and Environmental Engineering. During my study I learned a lot about structural engineering and construction management. I'm excited to be part of enhance programme because it's very important for future engineers to nurture humanitarian engineering attributes. In ITB I'm not only learn about how to be a professional engineer. But also how I can contribute to my society. My faculty always support students in their organization to do Community services. For example, in 2019, civil Engineering Student Association in ITB built a small weir to improve the irrigation system in Bandung region. I think this activity is highly relevant. to enhance program, I do enjoy our experience and learning during my study at ITB. I'm looking forward to being a professional engineer in the future who is keen on global and sustainable issues.
