

# Post-doc position available *on thermoelectric applications*

A Post-doc position is available for the development, fabrication and characterization of nanodevices for thermoelectric applications. The position will last for two years, with a grant of about 30 kEuro/year, with the possibility of extending it for one more year.

A good experimental practice is required in the fields of solid state physics, physical chemistry, device physics and, in particular, of nanofabrication and thermoelectric device characterization.

Skills in the field of electron-beam lithography, dry and wet etch, and semiconductor doping are very welcome.
