# Tight-binding

## total energy in tight-binding bond model

Sutton et al, J Phys C 1988

$$U_B = U_{\text{bond}} + U_{\text{prom}} + U_{\text{ion}} + U_{\text{es}} + U_{\text{rep}} + U_{\text{mag}}$$

distance-dependent matrix-elements for pairs of interacting atoms

eigenspectrum from diagonalisation of system-wide Hamiltonian

# Lanzcos recursion algorithm

transformation of TB Hamiltonian to new basis

$$\{|u_0\rangle, |u_1\rangle, |u_2\rangle, \dots\}$$

start at atomic-like state  $|u_0\rangle$  and generate  $|u_{n+1}\rangle$  recursively using

$$b_1|u_1\rangle = (\hat{H} - a_0)|u_0\rangle \quad b_{n+1}|u_{n+1}\rangle = (\hat{H} - a_n)|u_n\rangle - b_n|u_{n-1}\rangle$$

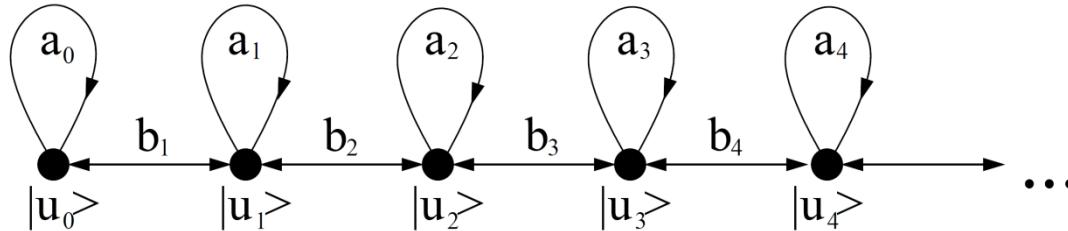

in this basis TB Hamiltonian takes tri-diagonal form

$$\langle u_n | \hat{H} | u_m \rangle = \begin{pmatrix} a_0 & b_1 & & & \\ b_1 & a_1 & b_2 & & \\ & b_2 & a_2 & b_3 & \\ & & b_3 & a_3 & b_4 \\ & & & b_4 & a_4 & \ddots \\ & & & & \ddots & \ddots & \ddots \\ & & & & & \ddots & \ddots & \ddots \end{pmatrix}$$

Haydock, Comp Phys Comm 1980  
Lanczos, J Res Natl Bur Stand 1950

# Continued fraction

interpretation: 1d Lanczos chain with only nearest-neighbor matrix elements

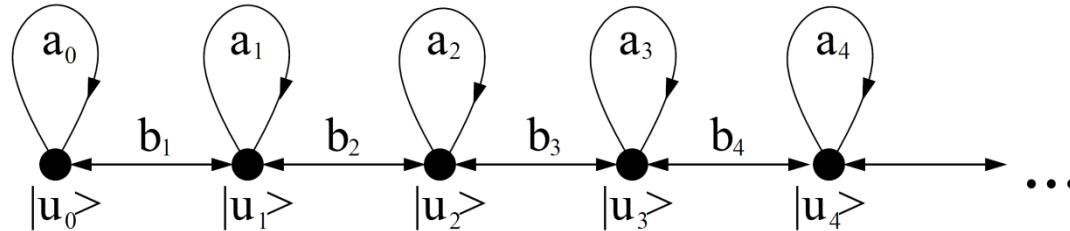

inversion of tridiagonal Hamiltonian by Greens functions yields continued fraction

$$n_{i\alpha}(E) = -\frac{1}{\pi} \text{Im} \frac{1}{E - a_0 - \frac{b_1^2}{E - a_1 - \frac{b_2^2}{E - a_2 - \frac{b_3^2}{\ddots}}}}$$

truncation after certain number of recursion levels  $\rightarrow$  linear-scaling BOP

# Connection to moments

interpretation: 1d chain with only nearest-neighbor matrix elements

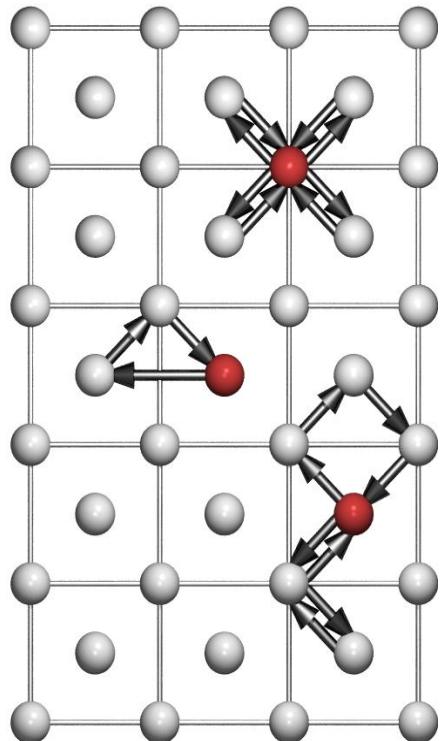

choose atomic orbital as starting orbital of Lanczos chain

$$\begin{aligned}\mu_{Ilm}^{(n)} &= \langle \varphi_{Ilm} | \hat{H}^n | \varphi_{Ilm} \rangle = \langle u_0 | \hat{H}^n | u_0 \rangle \\ &= \sum_{i_1 \dots i_{n-1}} \langle u_0 | \hat{H} | u_{i_1} \rangle \langle u_{i_1} | \hat{H} | u_{i_2} \rangle \dots \langle u_{i_{n-1}} | \hat{H} | u_0 \rangle\end{aligned}$$

direct relation of recursion coefficients to moments

$$\begin{aligned}\mu_{Ilm}^{(1)} &= a_0 \\ \xrightarrow{\hspace{1cm}} \mu_{Ilm}^{(2)} &= a_0^2 + b_1^2 \\ \mu_{Ilm}^{(3)} &= a_0^3 + 2a_0b_1^2 + a_1b_1^2\end{aligned}$$

# Moments expansion of DOS

second moment (rms width)

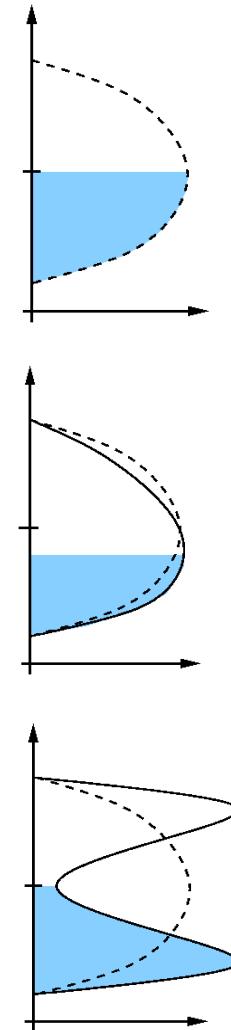

$$\mu_i^{(2)} = \int \epsilon^2 n_i(\epsilon) d\epsilon = \sum_j \langle i | \hat{H} | j \rangle \langle j | \hat{H} | i \rangle$$

third moment (skewing)

$$\mu_i^{(3)} = \int \epsilon^3 n_i(\epsilon) d\epsilon = \sum_{jk} \langle i | \hat{H} | j \rangle \langle j | \hat{H} | k \rangle \langle k | \hat{H} | i \rangle$$

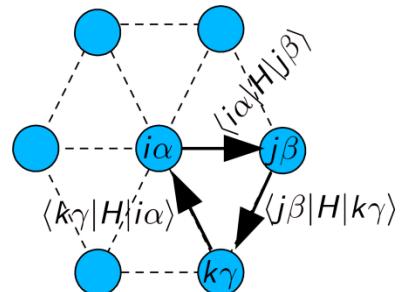

fourth moment (bimodality)

$$\mu_i^{(4)} = \int \epsilon^4 n_i(\epsilon) d\epsilon = \sum_{jkl} \langle i | \hat{H} | j \rangle \langle j | \hat{H} | k \rangle \langle k | \hat{H} | l \rangle \langle l | \hat{H} | i \rangle$$

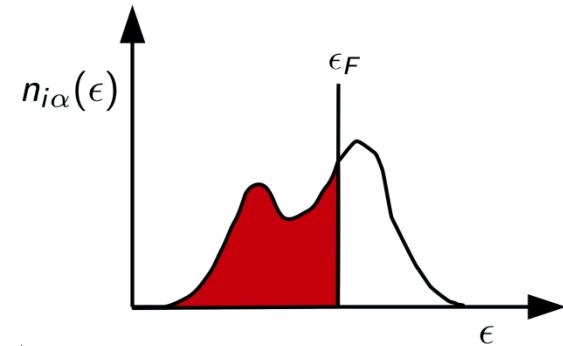

# Moments link electronic and crystal structure

## crystal structure

$$\mu_{i\alpha}^{(n)} = \langle i\alpha | H^n | i\alpha \rangle$$

## electronic structure

$$\mu_{i\alpha}^{(n)} = \int \epsilon^n n_{i\alpha}(\epsilon) d\epsilon$$

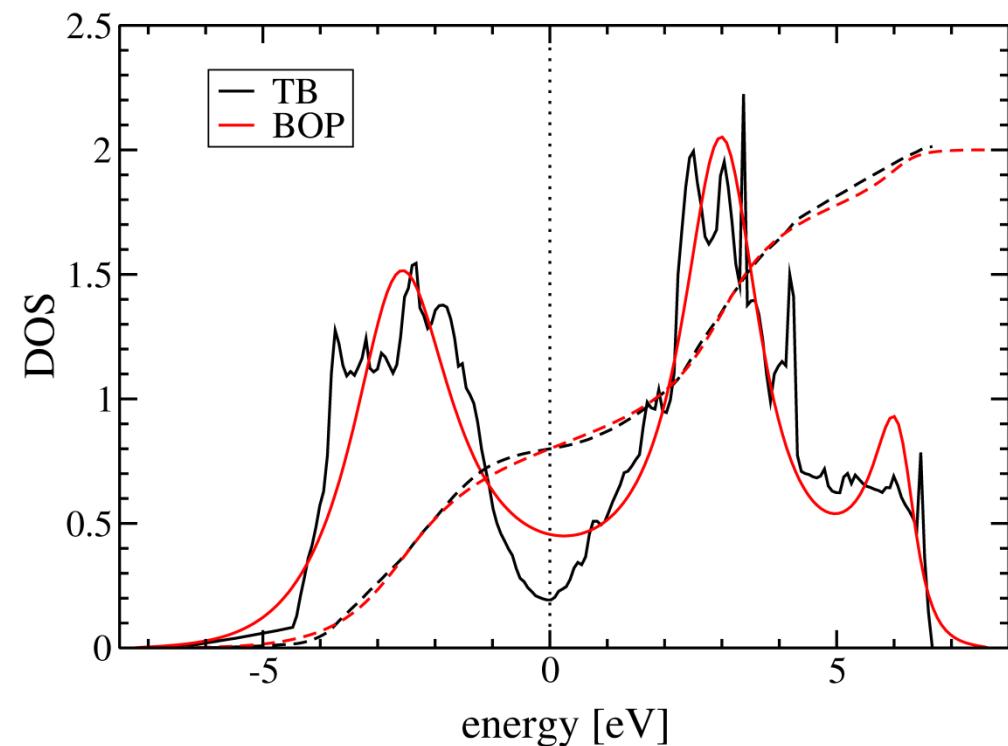

## bond energy

$$U_{bond} = \sum_{i\alpha} \int_{-\infty}^{\epsilon_F} \epsilon n_{i\alpha}(\epsilon) d\epsilon$$

Maximum importance: b6, atomic radius, bond energy, b2

# Conclusion

electronic-structure based descriptors

- coarse-graining DFT → TB → BOP
- moments link atomic structure and electronic structure
- low-dimensional representation of local atomic environments
- complete and homogeneous samplings of atomic environments
- chemistry-aware descriptor includes valence-type and band-filling
- bond-specific pair-wise Hamiltonians from downfolding DFT eigenspectrum

applications

- smooth variation of formation energy, volume and bulk modulus
- formation energies and bandgaps of transparent oxides
- formation energies and bulk moduli of intermetallic phases
- high relative importance of descriptors with domain knowledge

funding: DFG, SFB/TR103, DAAD, IMPRS SurMat, EPSRC
