Why Do We Need New Magnets?

- ▶ Permanent magnets find myriad applications, particularly for “green” technologies.
⇒ **increasing demand**
- ▶ Existing ‘gap’ in performance range of permanent magnets for advanced applications¹.
⇒ **need materials to fill the ‘gap’**

¹Coey, Scr. Mater. 67 524-529 3-8 (2012)

Why Transition Metals?

- ▶ Most permanent magnets for *advanced* applications currently use rare-earth (RE) elements—provide large MAE.
 ⇒ **constrained resources, environmental concerns**

Recipe for a Good Permanent Magnet

1. Large M_S , high T_C .
⇒ **Use elements such as Fe, Co, Ni, Mn**
2. Large magnetocrystalline anisotropy energy (MAE).
⇒ **Uniaxial crystal structure, spin-orbit coupling, appropriate composition**
3. Need to understand underlying electronic structure.
⇒ **Treat atomic ordering and MAE in same framework**

FeNi—Potential for High Anisotropy

- ▶ FeNi known to crystallise in L1₀ structure.
 - ✓ Large M_S
 - ✓ High T_C
 - ✓ Significant uniaxial anisotropy²
- ▶ Computationally predicted uniaxial MAE at $T = 0$:
 $K_U = 0.95 \text{ MJm}^{-3}$

²Woodgate, Patrick, Lewis, Staunton, J. Appl. Phys. **134** 163905 (2023).

FeNi—Phase Behaviour

- ▶ Model using DFT-based approach³⁴.

Paramagnetic			Ferromagnetic		
Material	T_{ord}	L1 ₀ ?	Material	T_{ord}	L1 ₀ ?
FeNi	175	No	FeNi	507	Yes

- ▶ Magnetic state *crucial* to L1₀ ordering.
- ▶ **Good, but can we do better?**
 - ▶ Higher T_{ord} ?
 - ▶ Larger K_U ?

⁴Woodgate, Lewis, Staunton, arXiv:2401.02809

Fe₄Ni₃X—Naive Calculation

- ▶ Put additive X exclusively on Ni site and calculate magnetic anisotropy.
- ▶ Additive 1: X = Pt
 - ▶ MAE: 3.44 MJm⁻³
- ▶ Additive 2: X = Al
 - ▶ MAE: 1.66 MJm⁻³
- ▶ **Looks good! Problem solved?**

(FePt has large MAE, strong ordering tendencies)

- ▶ 1a site occupancy: Fe₁₀₀
- ▶ 1d site occupancy: Ni₇₅X₂₅

⁴Woodgate, Lewis, Staunton, arXiv:2401.02809

Fe₄Ni₃X—Phase Behaviour

“All that glisters is not gold” - Shakespeare, Merchant of Venice

- ▶ Additive 1: $X = \text{Pt}$
 - ▶ L1₀-like ordering, but Pt-dominated.
 - ▶ Ferromagnetic state distinguishes Fe and Ni better.
- ▶ Additive 2: $X = \text{Al}$
 - ▶ Predicted ordering not even L1₀!
- ▶ **Anisotropies of predicted orderings?**

⁴Woodgate, Lewis, Staunton, arXiv:2401.02809

Fe₄Ni₃X—'Holistic' Magnetic Anisotropies

- ▶ Addition of Pt, annealing in *paramagnetic* state:
 - ▶ 1a site occupancy: Fe₆₁Ni₃₉
 - ▶ 1d site occupancy: Fe₃₉Ni₃₆Pt₂₅
 - ▶ Predicted MAE of 0.96 MJm⁻³

- ▶ Addition of Pt, annealing in *ferromagnetic* state:
 - ▶ 1a site occupancy: Fe₆₈Ni₃₂
 - ▶ 1d site occupancy: Fe₃₂Ni₄₃Pt₂₅
 - ▶ Predicted MAE of 1.22 MJm⁻³

⁴Woodgate, Lewis, Staunton, arXiv:2401.02809

Fe₄Ni₃Pt—'Ground-State' Structure

- ▶ Run Monte Carlo simulations—simulated annealing.
- ▶ Example: addition of Pt.
- ▶ Find a novel ground-state tetragonal structure.
- ▶ Anisotropy of compound is 2.77 MJm⁻³.

⁴Woodgate, Lewis, Staunton, arXiv:2401.02809

Summary

Take-Home Message 1

Additives to FeNi system have the potential to improve atomic ordering tendencies (uniaxial structures) and magnetic anisotropy.

Take-Home Message 2

HOWEVER, it is necessary to understand on which lattice site(s) additives prefer to sit.

Take-Home Message 3

Enlarged, multicomponent, compositional search space is needed, not just FeNi plus alloying addition.
