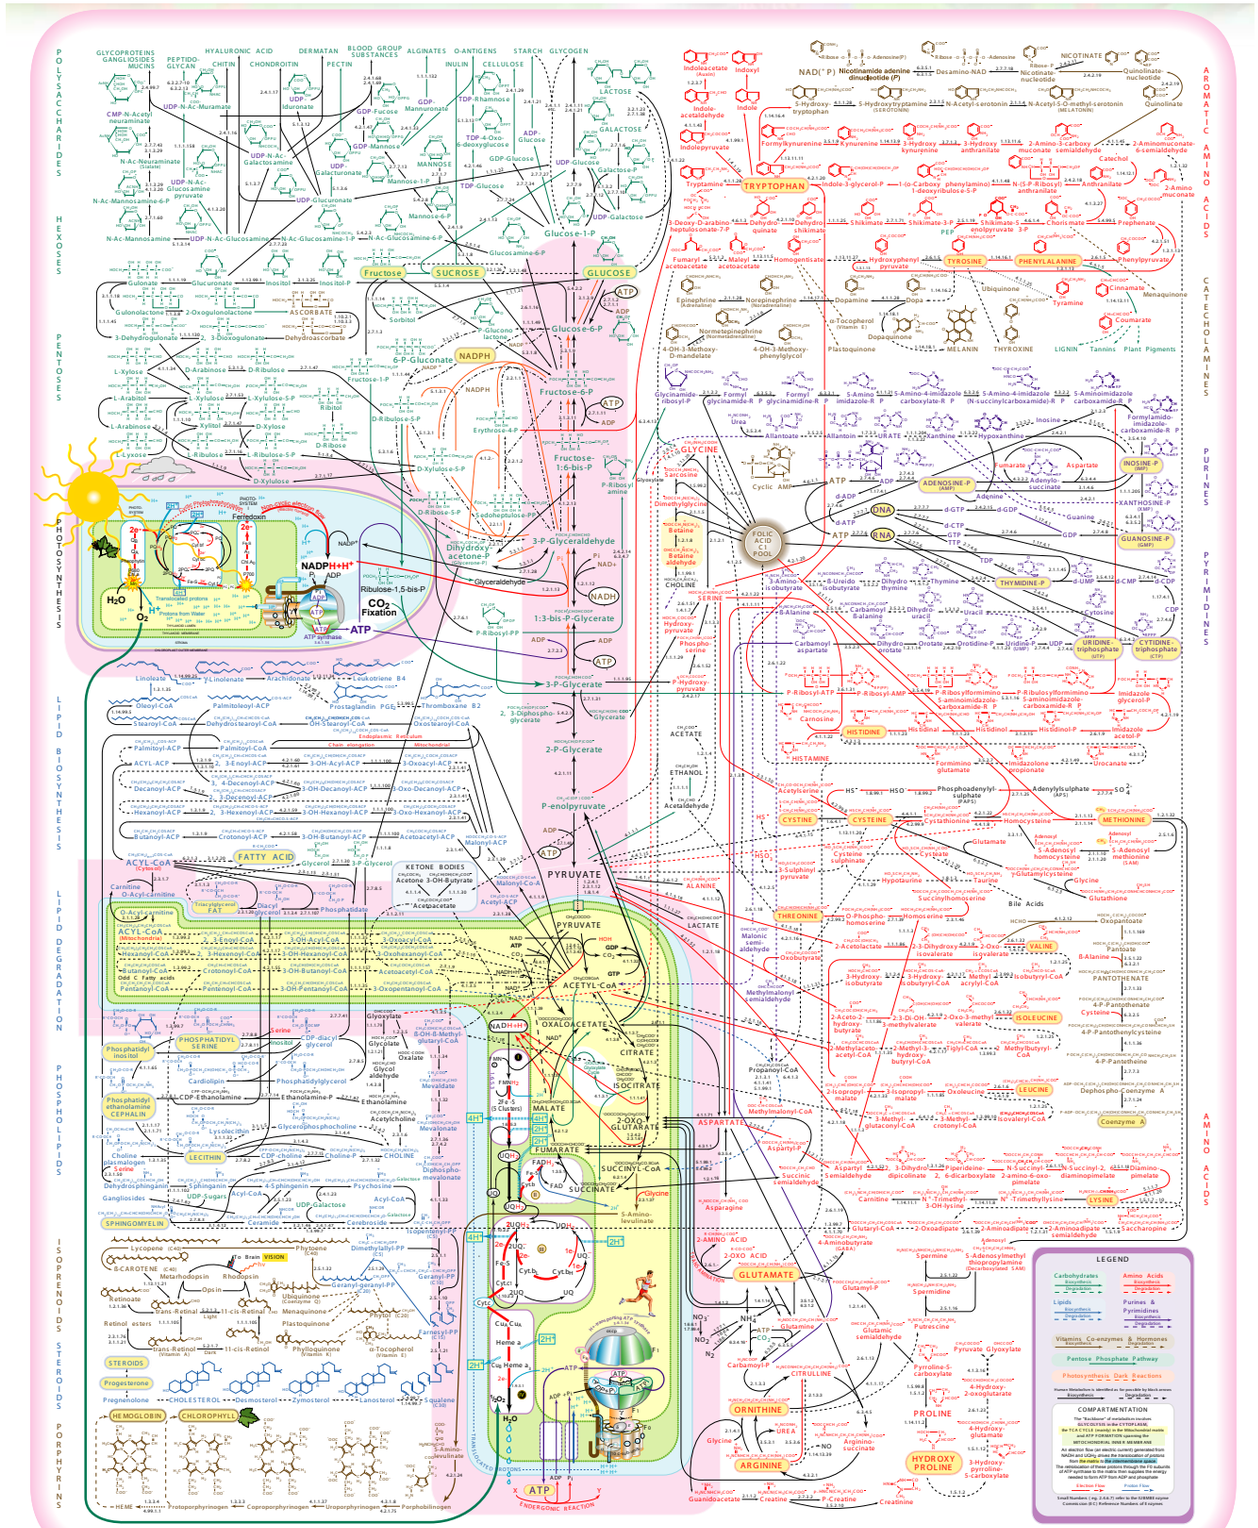
Bio Electrical Engineering
Innovation Hub @ Warwick

WARWICK
THE UNIVERSITY OF WARWICK

I'm interested in understanding cell metabolism / physiology



Metabolism is the process through which cells acquire energy **to make biomass**

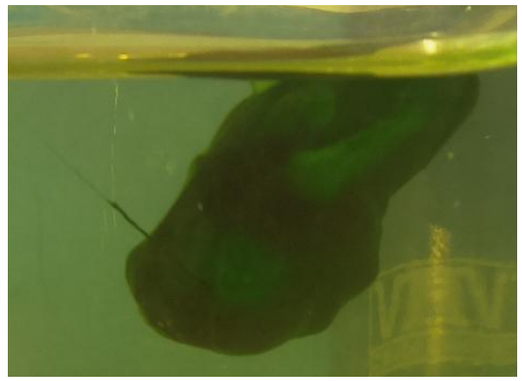
This is the dominant view driving the analysis of metabolism.

e.g; Flux Balance Analysis (FBA) implements biomass optimality, metabolic models consider pathways optimised separately for biomass, etc.

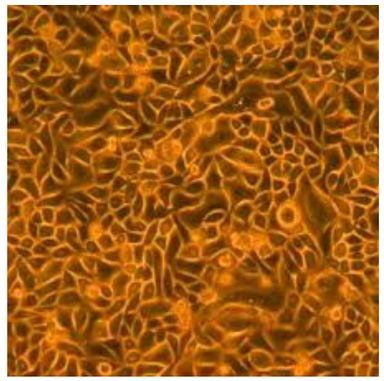
Metabolism before a cell

Selection? Selection on what?

Metabolism without growth



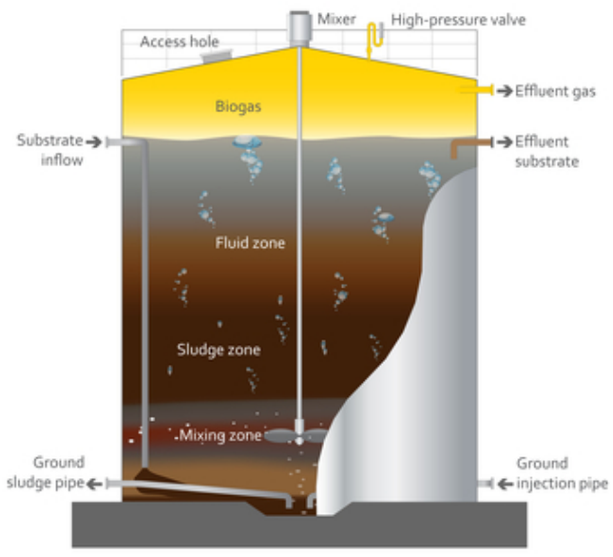
Environmental microbes



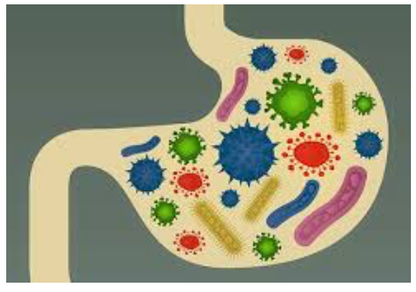
Healthy tissue

….

Metabolism across cells



Anaerobic digestion



Animal gut

….

Maybe we need an alternative <u>conceptual</u> view on metabolism?

Adaptive evolution

The dream of every cell is to become two cells

François Monod

Metabolism optimised for biomass production

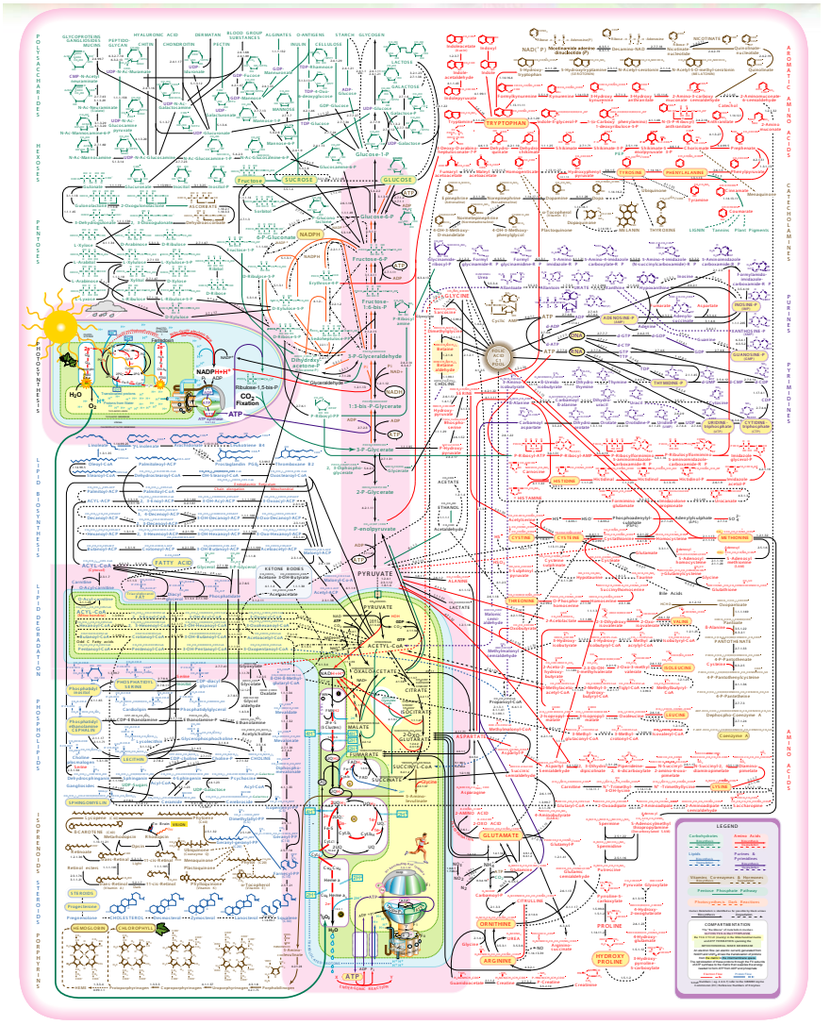
Metabolism invented biomass to stabilise a state of nonequilibrium thermodynamics

Neutral evolution

Life is an electron looking for a place to rest

Albert Szent-Györgyi

Metabolism as an electron flow system shaped by thermodynamic bottlenecks and biophysical tradeoffs

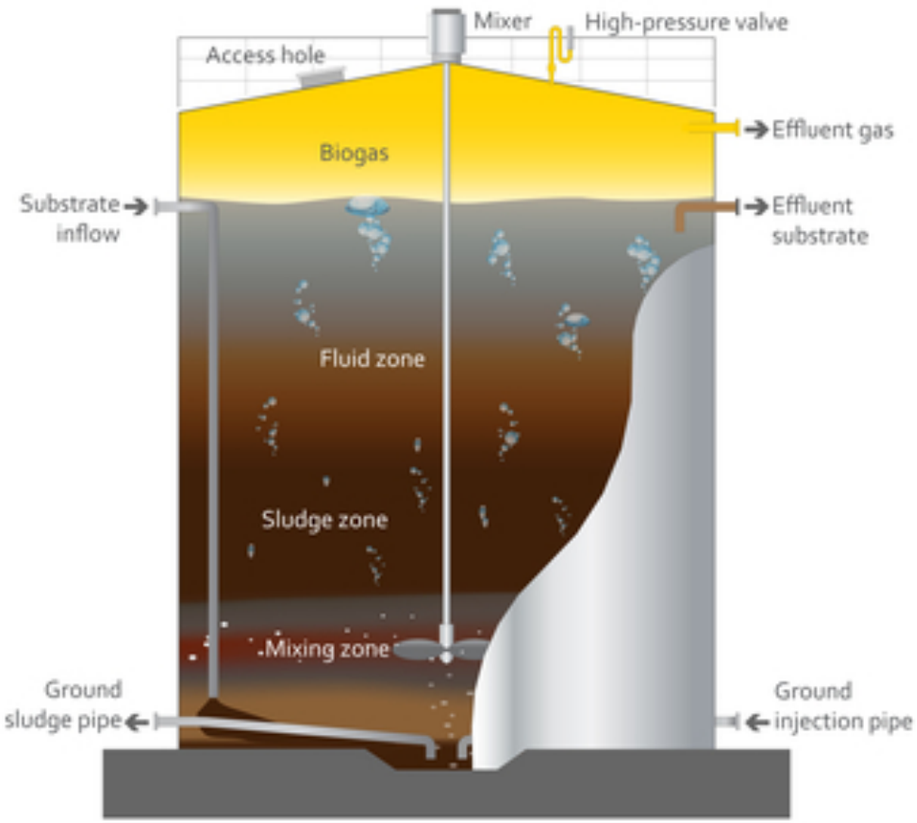


Interrogating metabolism as an electron flow system.

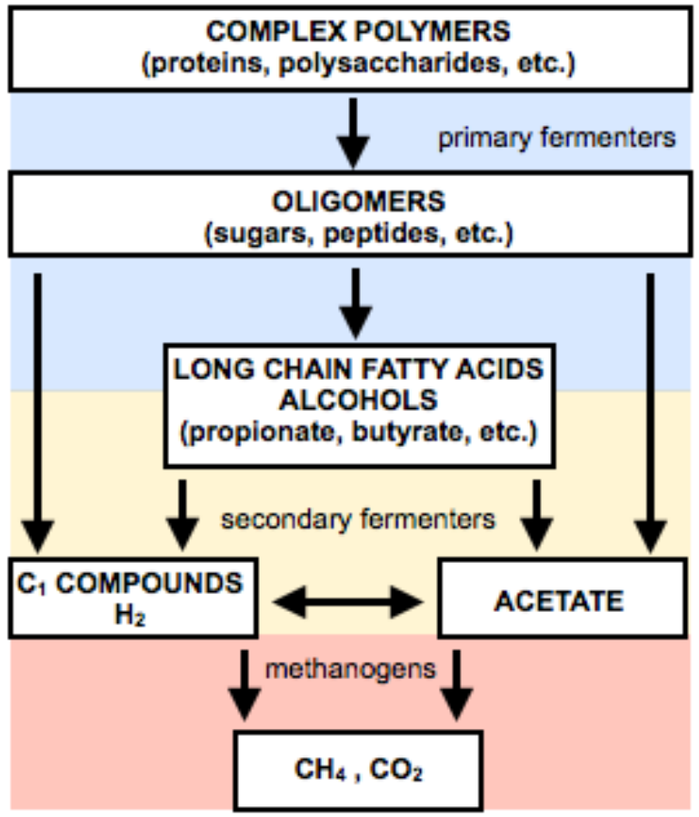
Christian Zerfass, Munehiro Asally, Orkun S Soyer

Current Opinion in Systems Biology *13: 59-67 (2019).*

Vignette 1: Thermodynamic bottlenecks



Anaerobic digestion

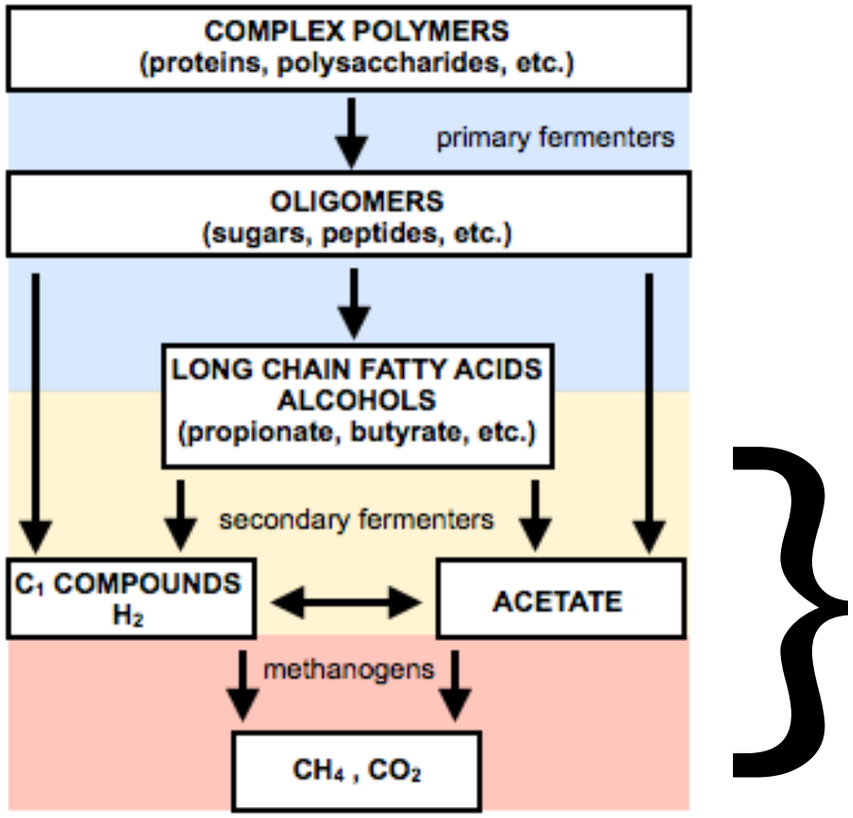


Schink B *Microbiol Mol Biol Rev* 61:2 (1997)

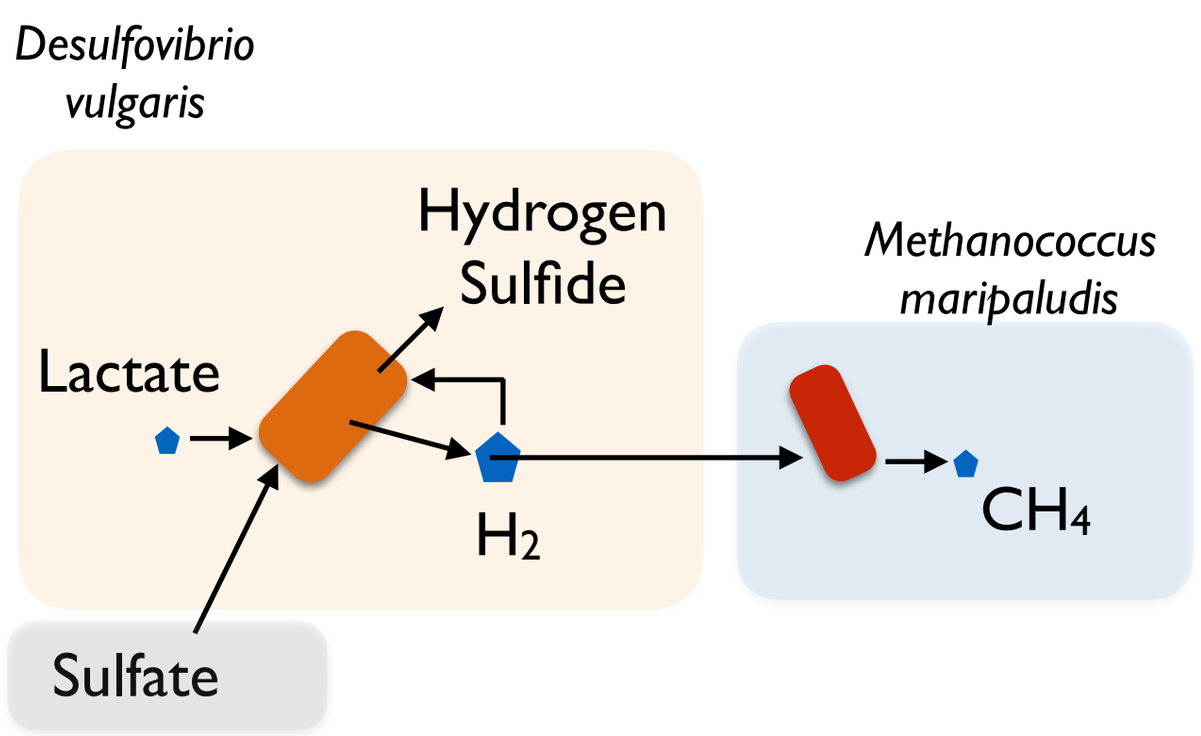
Engineer synthetic communities to learn about biochemical basis of communities

Grosskopf & Soyer, ***Curr. Op. Biotech*** (2014)

Syntrophy: Crucial in all AD systems

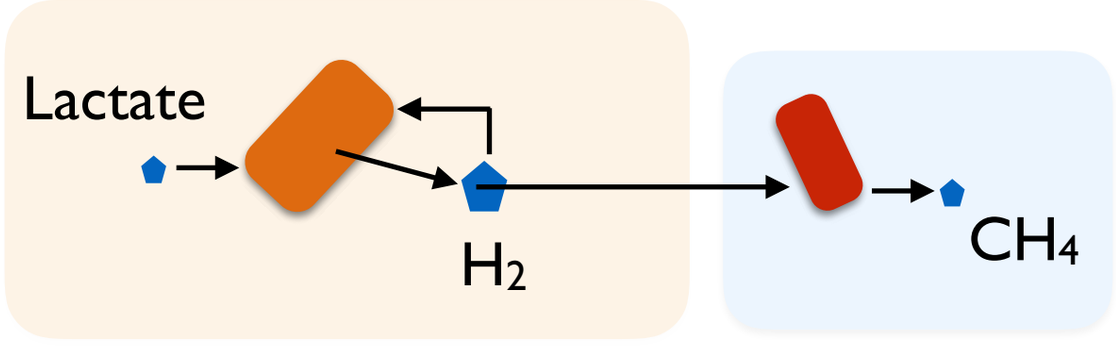


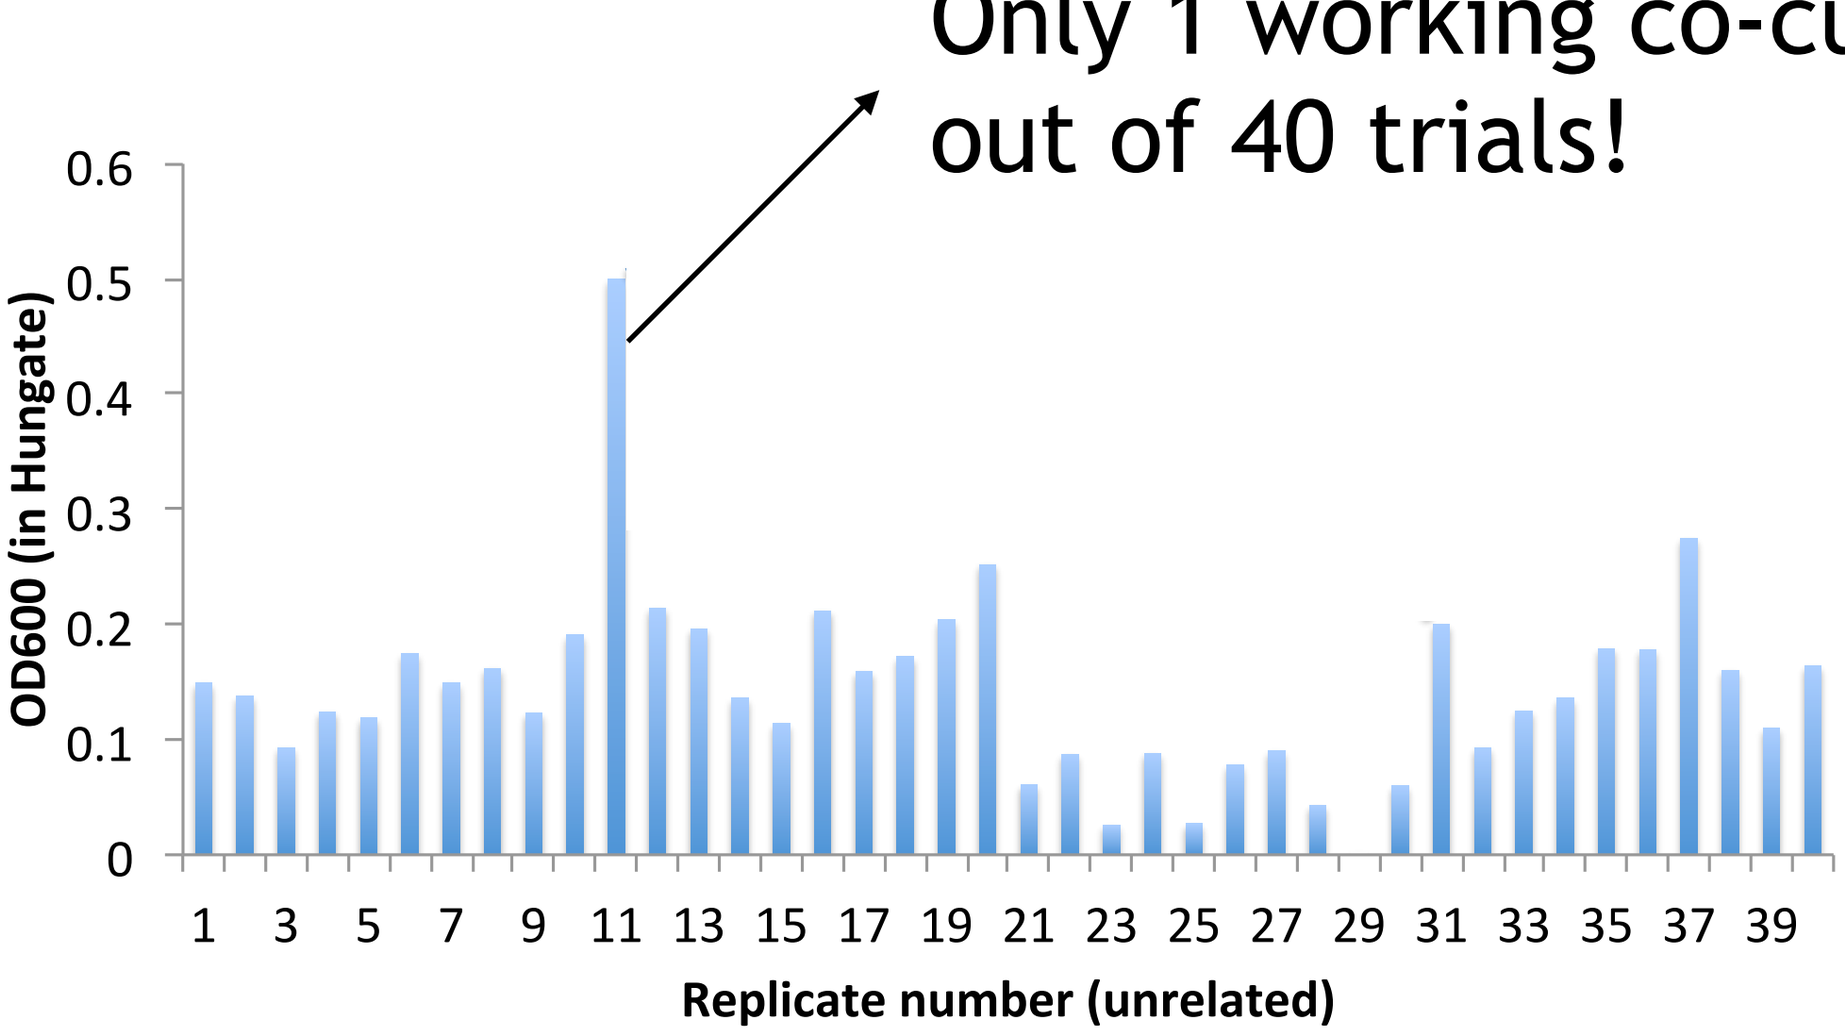
Schink B *Microbiol Mol Biol Rev* 61:2 (1997)



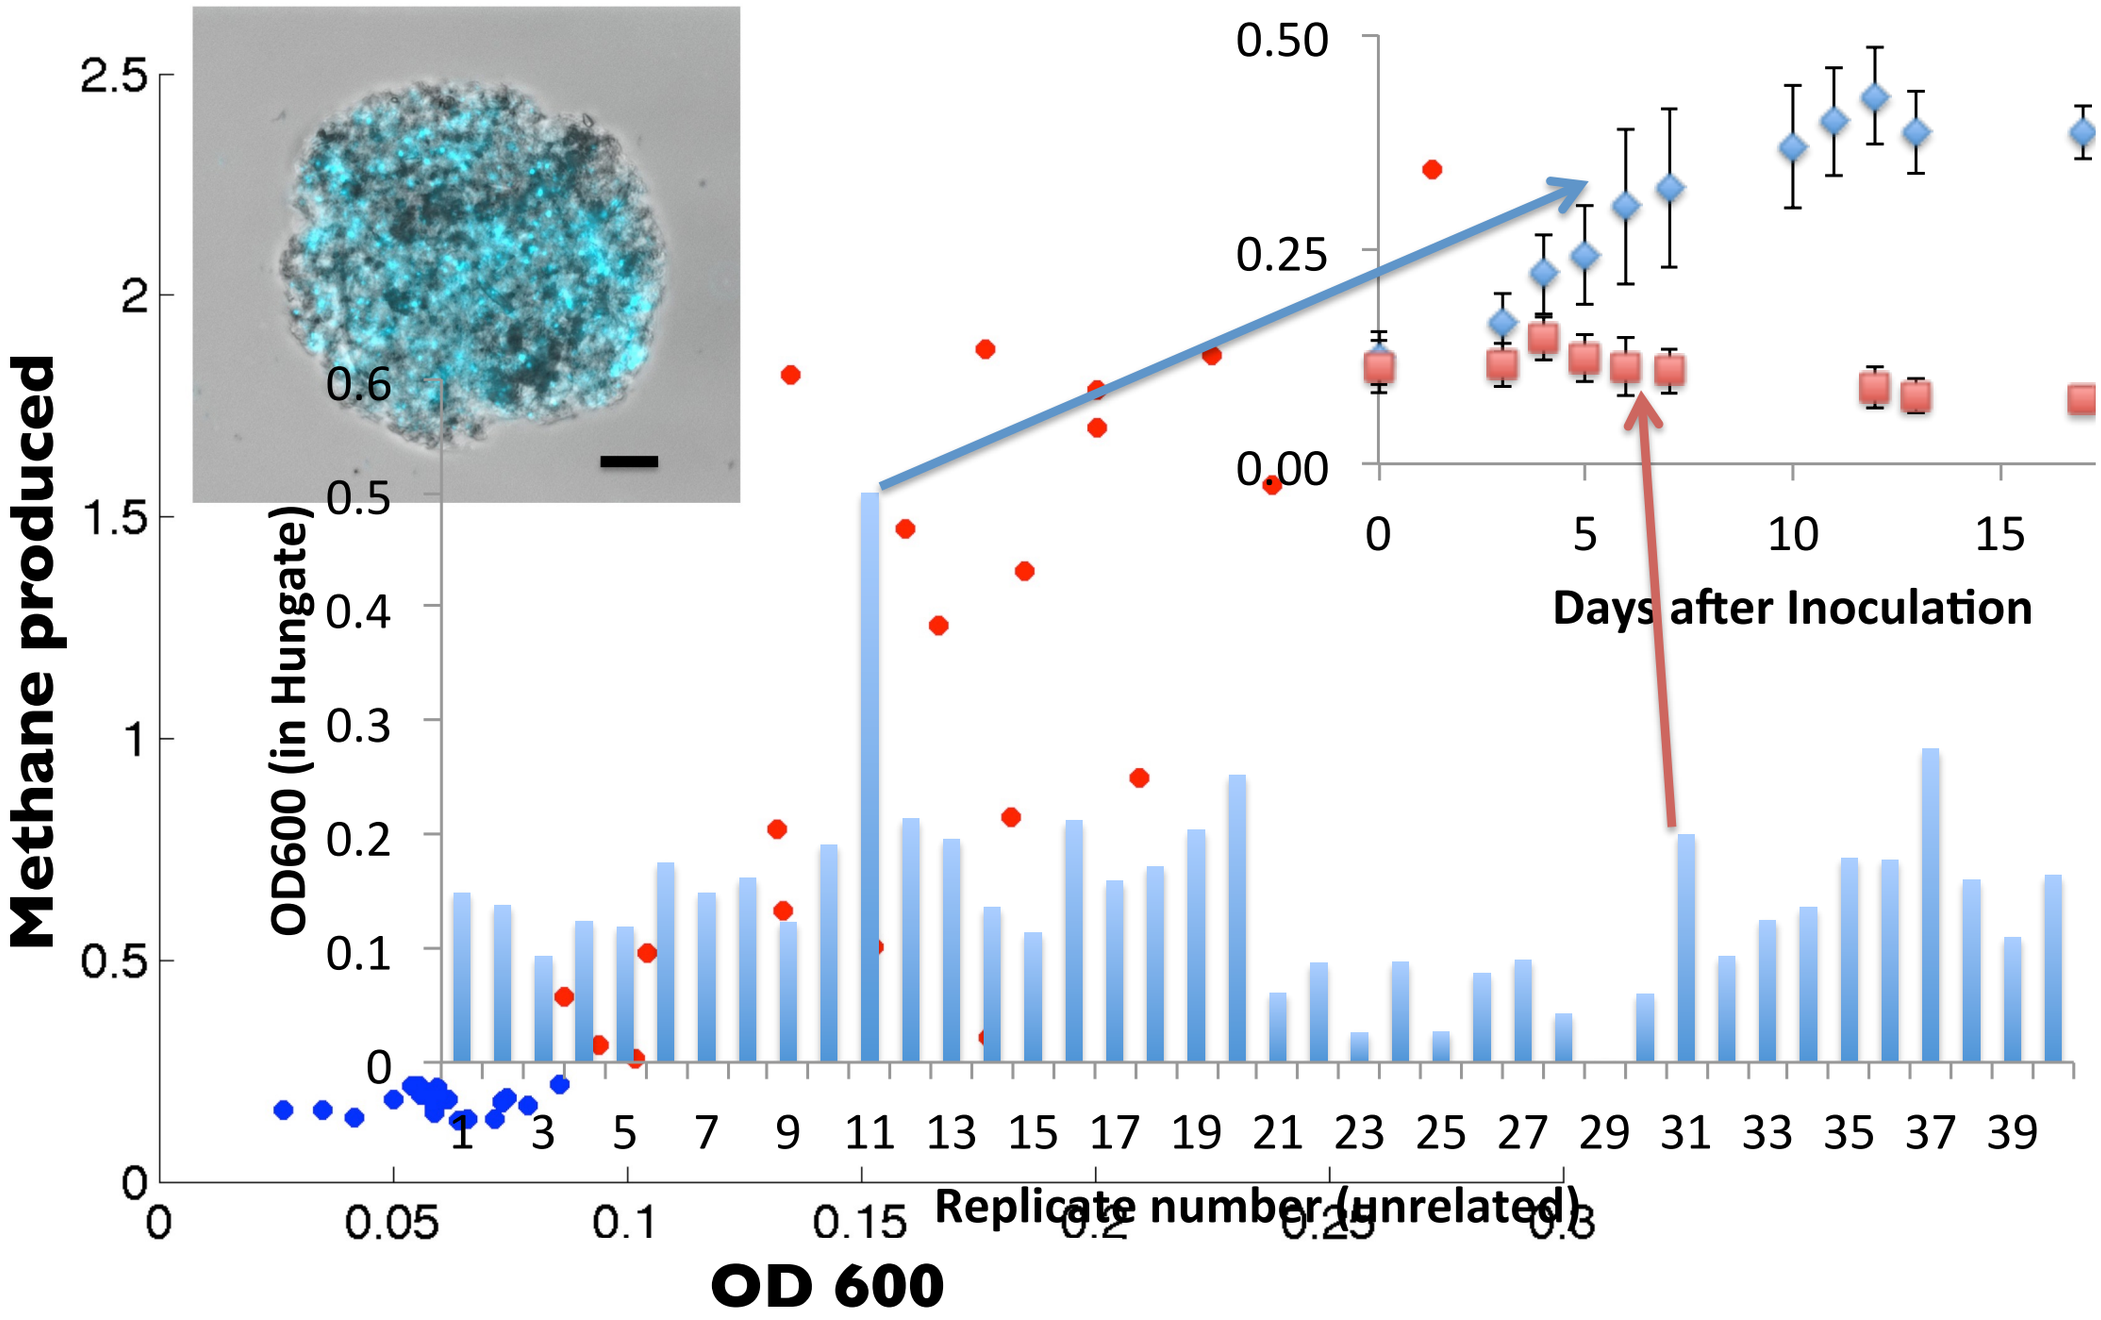
$$\text{Lactate} + 2\text{Sulfate} + 3H^{+} \longrightarrow 3CO_2 + 2HS^{-} + 3H_2O \qquad \Delta G_0 = -259.09 \text{ kJ/mol}$$

Model system to understand the basis of syntrophy:





Isolates from co-culture are consistently “syntrophic”, while those from wild type are not



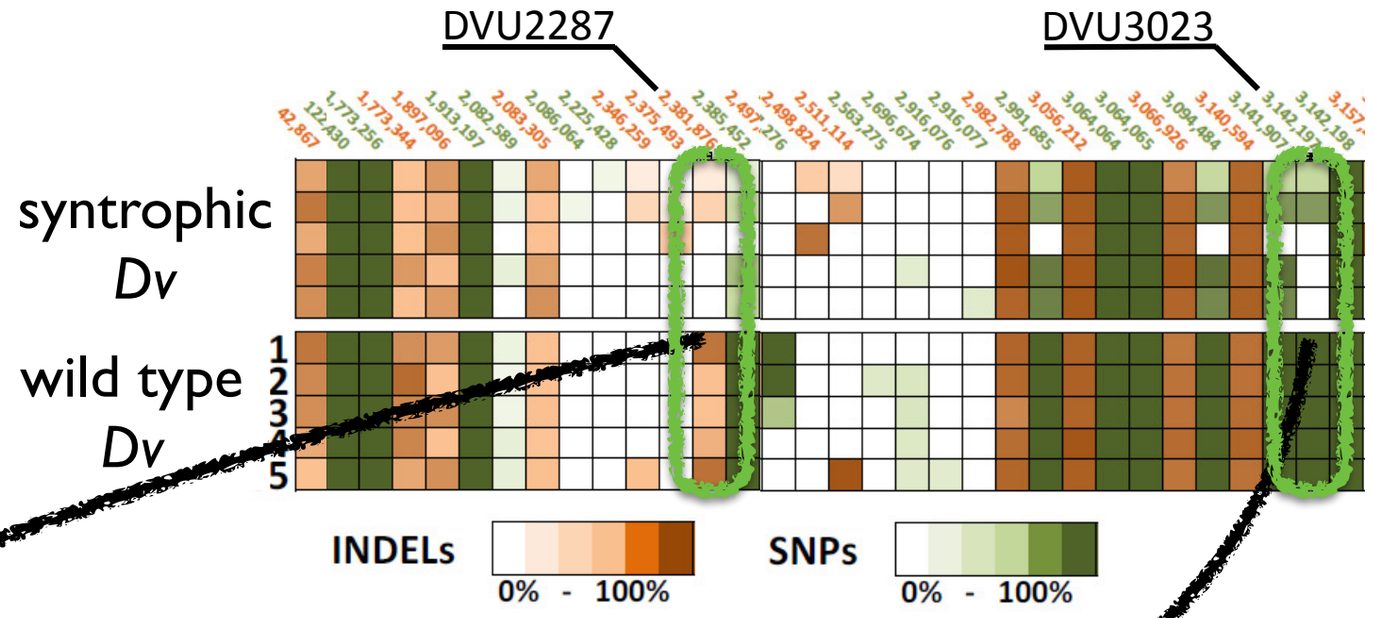
Syntrophy made possible by energy investment to overcome thermodynamics hurdle

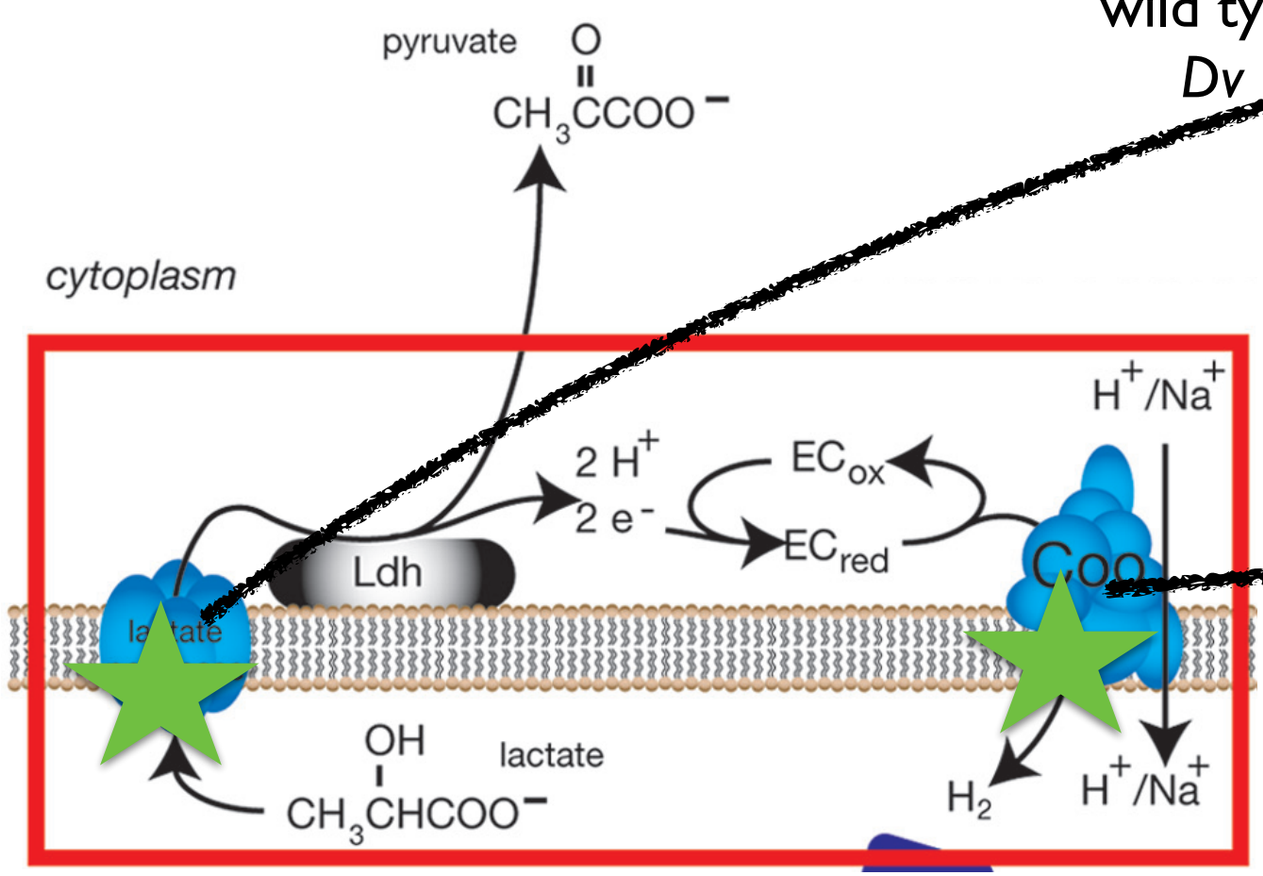
$$\text{Lactate} + H_2O \longrightarrow \text{Acetate} + CO_2 + 2H_2 \qquad \Delta G_0 = -8.79 \text{ kJ/mol}$$

?

$$\text{Lactate} \longrightarrow \text{Pyruvate} + H_2 \qquad \Delta G_0 = 43 \text{ kJ/mol}$$

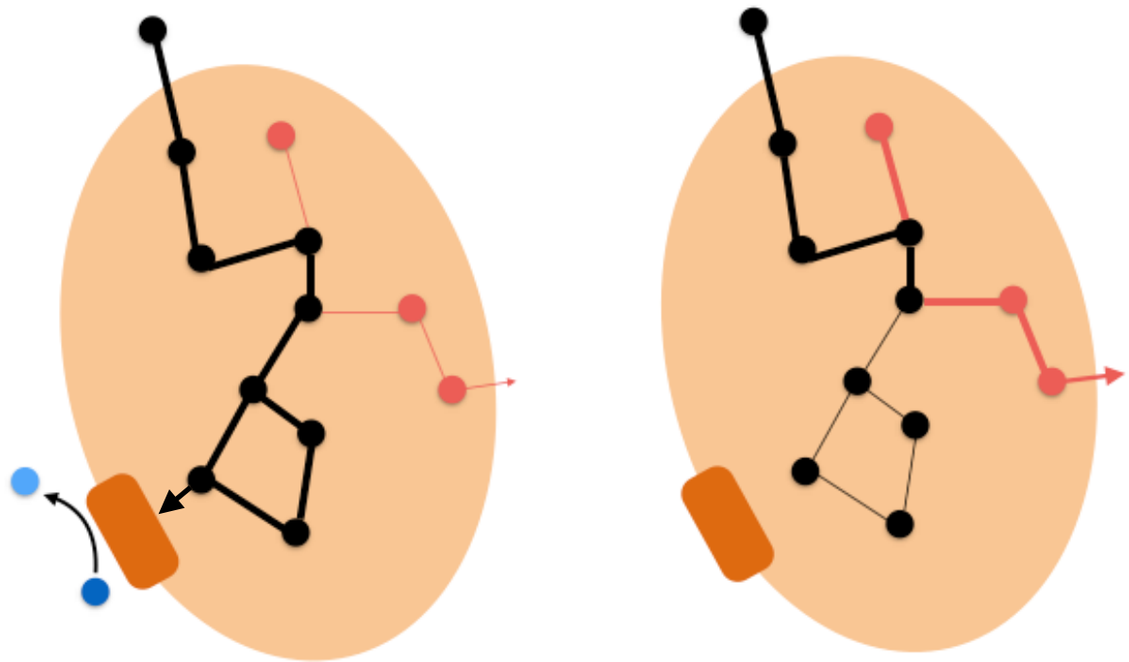
$$Na^+ \text{ (out)} \longrightarrow Na^+ \text{(in)}$$





Grosskopf T. et al. ***ISME J.*** (2016).

Vignette 1: Thermodynamic inhibition due to terminal electron acceptor availability can be a key driver of evolution of metabolic systems (intra- and inter-cellular)



Ethanol, Acetate, Lactate, Butyrate, H_2…

High energy respiratory pathways

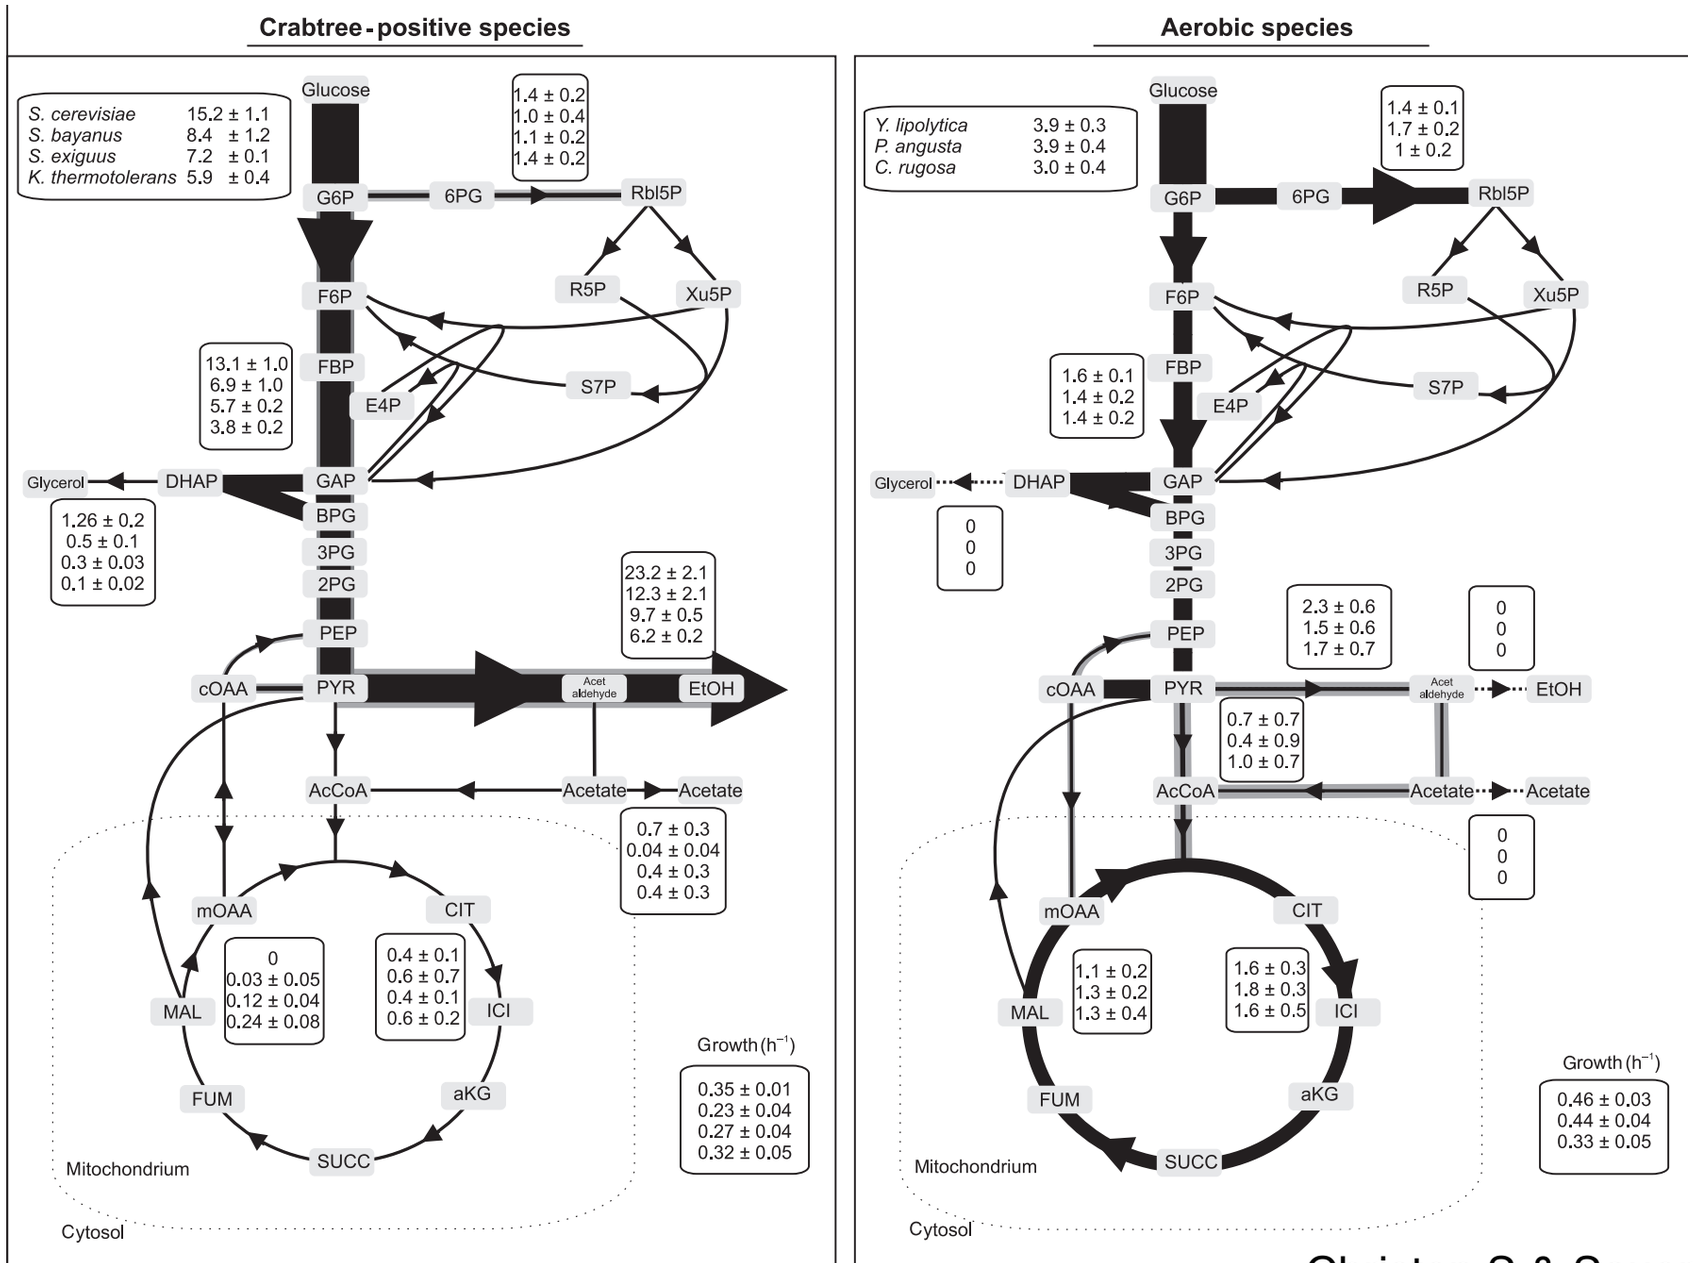
$$\Delta G_0 < -500 kJ / mol$$

Low energy fermentative pathways

$$\Delta G_0 > -300 kJ / mol$$

Test 1: Use electrodes as terminal electron acceptors to control metabolism via electrode potential

Vignette 2: Cellular trade-offs



Christen S & Sauer U, ***FEMS*** (2011)

Fermentation can still happen in the presence of terminal electron acceptor like oxygen

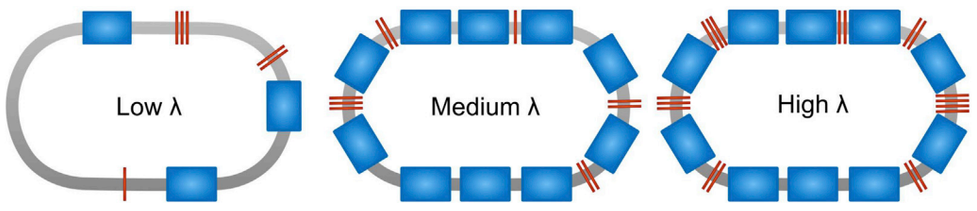
Trade-offs in cellular metabolism can <u>explain</u> respiro-fermentation (overflow metabolism):

Trade-offs in space/enzyme allocation

Szenk M, Dill KA, de Graff AMR, *Cell Systems 5* (2017)

Basan M, et al., *Nature 528* (2015)

….

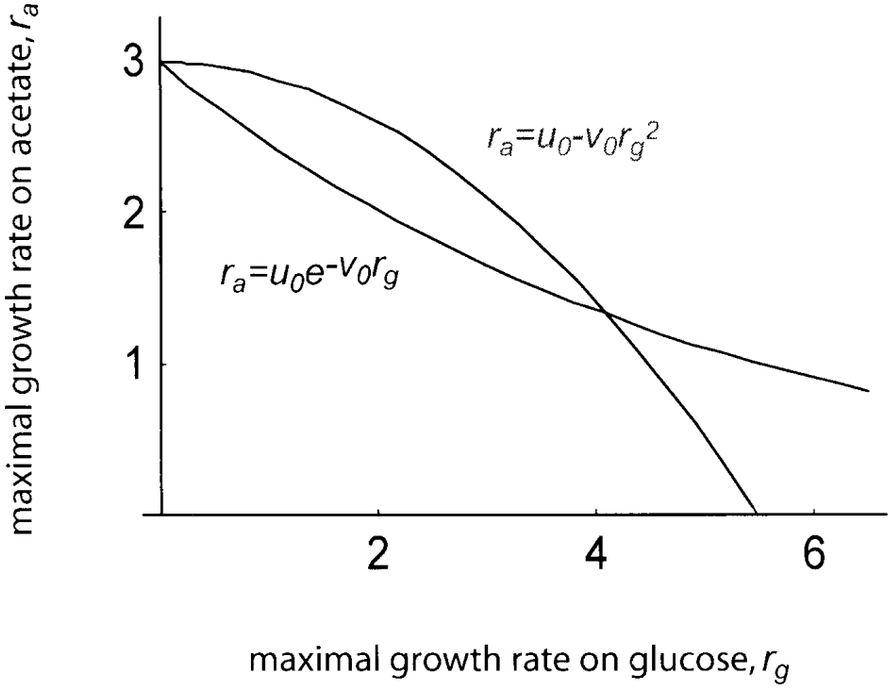


Trade-offs in pathway rate and yield

Pfeiffer T, Schuster S, Bonhoeffer S, *Science* 292 (2001)

Trade-offs in substrate-based growth rates

Doebeli M, *Pop. Ecology* 44:2 (2002)



Can trade-offs lead to <u>evolution</u> of overflow metabolism under selection for biomass?
