### Exercise 3.1

Let  $X$  be a topological space and  $R$  a commutative ring with unit. Let  $\epsilon \in C^0(X; R)$  be the *augmentation homomorphism*: for all singular zero-simplices  $\sigma^0$  we have  $\epsilon(\sigma^0) = 1_R$ . Prove that the cup product at the level of cochains is  $R$ -linear in both variables, associative, and has  $\epsilon \in C^0(X; R)$  as its identity element.

Recall that the cup product is defined on singular cochains by

$$(\varphi \smile \psi)(\sigma) = \varphi(\sigma|_{[v_0, \dots, v_k]})\psi(\sigma|_{[v_k, \dots, v_{k+\ell}]}), \quad \varphi \in C^k(X; R), \psi \in C^\ell(X; R), \sigma \in C_{k+\ell}(X).$$

**R-linearity:** For  $a_i, b_i \in R$ ,  $\varphi_i \in C^k(X; R)$ ,  $\psi_i \in C^\ell(X; R)$

$$\begin{aligned} \left( \sum_{i=1}^n a_i \varphi_i \smile \psi \right) (\sigma) &= \left( \sum_{i=1}^n a_i \varphi_i \right) (\sigma|_{[v_0, \dots, v_k]}) \psi(\sigma|_{[v_k, \dots, v_{k+\ell}]}) \\ &= \sum_{i=1}^n a_i \varphi_i(\sigma|_{[v_0, \dots, v_k]}) \psi(\sigma|_{[v_k, \dots, v_{k+\ell}]}) \\ &= \sum_{i=1}^n a_i (\varphi_i \smile \psi)(\sigma); \\ \left( \varphi \smile \sum_{i=1}^n b_i \psi_i \right) (\sigma) &= \varphi(\sigma|_{[v_0, \dots, v_k]}) \left( \sum_{i=1}^n b_i \psi_i \right) (\sigma|_{[v_k, \dots, v_{k+\ell}]}) \\ &= \sum_{i=1}^n b_i \varphi(\sigma|_{[v_0, \dots, v_k]}) \psi_i(\sigma|_{[v_k, \dots, v_{k+\ell}]}) \\ &= \sum_{i=1}^n b_i (\varphi \smile \psi_i)(\sigma). \end{aligned}$$

**Associativity:** For  $\varphi \in C^i(X; R)$ ,  $\psi \in C^j(X; R)$ ,  $\chi \in C^k(X; R)$ ,  $\sigma \in C_{i+j+k}(X)$ ,

$$\begin{aligned} (\varphi \smile (\psi \smile \chi))(\sigma) &= \varphi(\sigma|_{[v_0, \dots, v_i]}) (\psi \smile \chi)(\sigma|_{[v_i, \dots, v_{i+j+k}]})) \\ &= \varphi(\sigma|_{[v_0, \dots, v_i]}) \psi((\sigma|_{[v_i, \dots, v_{i+j+k}]})|_{[v_0, \dots, v_j]}) \chi((\sigma|_{[v_i, \dots, v_{i+j+k}]})|_{[v_j, \dots, v_{j+k}]}) \\ &= \varphi(\sigma|_{[v_0, \dots, v_i]}) \psi(\sigma|_{[v_i, \dots, v_{i+j}]})) \chi(\sigma|_{[v_{i+j}, \dots, v_{i+j+k}]})) \\ &= \varphi((\sigma|_{[v_0, \dots, v_{i+j}]})|_{[v_0, \dots, v_i]}) \psi((\sigma|_{[v_0, \dots, v_{i+j}]})|_{[v_i, \dots, v_{i+j}]})) \chi(\sigma|_{[v_{i+j}, \dots, v_{i+j+k}]})) \\ &= (\varphi \smile \psi)(\sigma|_{[v_0, \dots, v_{i+j}]})) \chi(\sigma|_{[v_{i+j}, \dots, v_{i+j+k}]})) \\ &= ((\varphi \smile \psi) \smile \chi)(\sigma). \end{aligned}$$

**Identity:** For  $\varphi \in C^k(X; R)$ ,

$$\begin{aligned} (\varphi \smile \epsilon)(\sigma) &= \varphi(\sigma|_{[v_0, \dots, v_k]}) \epsilon(\sigma|_{[v_k]}) = \varphi(\sigma) \cdot 1_R = \varphi(\sigma); \\ (\epsilon \smile \varphi)(\sigma) &= \epsilon(\sigma|_{[v_0]}) \varphi(\sigma|_{[v_0, \dots, v_k]}) = 1_R \cdot \varphi(\sigma) = \varphi(\sigma). \end{aligned}$$

**Exercise 3.2**

- (i) Give a  $\Delta$ -complex structure on the torus  $T^2 = S^1 \times S^1$ .
- (ii) Using (i), describe the simplicial chain complex associated to the  $\Delta$ -complex structure of item (i) (with  $R = \mathbb{Z}$ ).
- (iii) Using (ii), compute the homology groups of  $T^2$ .
- (iv) Using (i) and (ii), describe the simplicial cochain complex associated to the  $\Delta$ -complex structure of item (i) (with  $R = Q = \mathbb{Z}$ ).
- (v) Using (iv), compute the cohomology groups of  $T^2$ .
- (vi) Compute the cohomology ring  $H^*(T^2; \mathbb{Z})$ .

- (ii)
  - 0-simplex:  $v$ .
  - 1-simplices:  $a, b, c$ :  $\partial a = \partial b = \partial c = v - v = 0$ .
  - 2-simplices:  $D_1, D_2$ :  $\partial D_1 = \partial D_2 = a + b - c$ .

Therefore the simplicial chain complex is given by:

$$0 \longrightarrow \mathbb{Z}D_1 \oplus \mathbb{Z}D_2 \xrightarrow{\begin{pmatrix} 1 & 1 \\ 1 & 1 \\ -1 & -1 \end{pmatrix}} \mathbb{Z}a \oplus \mathbb{Z}b \oplus \mathbb{Z}c \xrightarrow{0} \mathbb{Z}v \longrightarrow 0$$

1
0

- (iii) Denote by  $\varphi : \mathbb{Z}D_1 \oplus \mathbb{Z}D_2 \rightarrow \mathbb{Z}a \oplus \mathbb{Z}b \oplus \mathbb{Z}c$  the linear map associated to the matrix  $\begin{pmatrix} 1 & 1 \\ 1 & 1 \\ -1 & -1 \end{pmatrix}$ . Then

- $H_0(T^2) = \mathbb{Z}v \cong \mathbb{Z}$ ;
- $H_1(T^2) = \text{coker } \varphi = \frac{\mathbb{Z}a \oplus \mathbb{Z}b \oplus \mathbb{Z}c}{\langle a + b - c \rangle} \cong \mathbb{Z}^2$ , with  $a, b$  being the generators.
- $H_2(T^2) = \ker \varphi = \mathbb{Z}(D_1 - D_2) \cong \mathbb{Z}$ .
- $H_i(T^2) = 0$  for  $i \neq 0, 1, 2$ .

- (iv) Applying the functor  $\text{Hom}_{\mathbb{Z}}(-, \mathbb{Z})$  to the simplicial chain complex:

$$0 \longleftarrow \mathbb{Z}D_1^* \oplus \mathbb{Z}D_2^* \xleftarrow{\begin{pmatrix} 1 & 1 & -1 \\ 1 & 1 & -1 \end{pmatrix}} \mathbb{Z}a^* \oplus \mathbb{Z}b^* \oplus \mathbb{Z}c^* \xleftarrow{0} \mathbb{Z}v^* \longleftarrow 0$$

2
1
0

- (v)
  - $H^0(T^2; \mathbb{Z}) = \mathbb{Z}v^* \cong \mathbb{Z}$ ;
  - $H^1(T^2; \mathbb{Z}) = \ker \varphi^* = \mathbb{Z}(a^* + c^*) \oplus \mathbb{Z}(b^* + c^*) \cong \mathbb{Z}^2$ ;
  - $H^2(T^2; \mathbb{Z}) = \text{coker } \varphi^* = \frac{\mathbb{Z}D_1^* \oplus \mathbb{Z}D_2^*}{\langle D_1 + D_2 \rangle} \cong \mathbb{Z}$ , with  $D_1^* = -D_2^*$  being the generator.
  - $H^i(T^2; \mathbb{Z}) = 0$  for  $i \neq 0, 1, 2$ .

- (vi) Let  $\alpha^* := a^* + c^*$  and  $\beta^* := b^* + c^*$  be the generators of  $H^1(T^2; \mathbb{Z})$ . We need to compute the cup product of them. Note that  $2(\alpha^* \smile \alpha^*) = 2(\beta^* \smile \beta^*) = 0 \in H^2(T^2; \mathbb{Z})$  by graded commutativity. Since  $H^2(T^2; \mathbb{Z})$  has

no torsion, we must have  $\alpha^* \smile \alpha^* = \beta^* \smile \beta^* = 0$ . It remains to compute  $\alpha^* \smile \beta^*$ . We use the definition:

$$\begin{aligned} (\alpha^* \smile \beta^*)(D_1) &= \alpha^*(D_1|_{[v_0, v_1]})\beta^*(D_1|_{[v_1, v_2]}) = \alpha^*(a)\beta^*(b) = 1; \\ (\alpha^* \smile \beta^*)(D_2) &= \alpha^*(D_2|_{[v_0, v_1]})\beta^*(D_2|_{[v_1, v_2]}) = \alpha^*(b)\beta^*(a) = 0. \end{aligned}$$

Hence  $\alpha^* \smile \beta^* = D_1^*$  on the cochain level. We lift this to cohomology and deduce that  $H^2(T^2; \mathbb{Z}) = \mathbb{Z}D_1^*$  is generated by  $\alpha^* \smile \beta^*$ . In conclusion, we have the isomorphism as graded rings:

$$H^\bullet(T^2; \mathbb{Z}) \cong \frac{\mathbb{Z}\langle x, y \rangle}{\langle x^2, y^2, xy + yx \rangle} \cong \frac{\mathbb{Z}\langle x \rangle}{\langle x^2 \rangle} \otimes_{\mathbb{Z}} \frac{\mathbb{Z}\langle y \rangle}{\langle y^2 \rangle} \cong \wedge^\bullet(\mathbb{Z}x \oplus \mathbb{Z}y), \quad |x| = |y| = 1.$$

Another way to visualise this cup product computation is through **intersection theory**<sup>1</sup>: let  $\alpha, \beta \in H_1(T^2)$  be the Poincaré duals of  $\alpha^*, \beta^*$  respectively. They are represented by the 1-cycles  $\alpha, \beta$  as shown in the diagram:

We identify  $H^2(T^2; \mathbb{Z})$  with  $\mathbb{Z}$  by  $D_1^* \mapsto 1$ . Then the cup product  $\alpha^* \smile \beta^*$  is the same as the intersection product  $\alpha \cdot \beta$ , which is the number of intersection points of the cycles  $\alpha$  and  $\beta$ , counted with signs and multiplicities.

From the diagram, we observe that  $\alpha \cdot \beta = 1$ , as they intersect transversely at one point.  $\alpha \cdot \alpha = 0$  because we can deform  $\alpha$  to  $\alpha'$  within the same homology class such that  $\alpha$  and  $\alpha'$  are disjoint cycles. Similarly  $\beta \cdot \beta = 0$ . This visualisation is verified by our previous computation:

$$\alpha^* \smile \alpha^* = \beta^* \smile \beta^* = 0, \quad \alpha^* \smile \beta^* = D_1^*.$$

<sup>1</sup>We do not make this rigorous, so it is only for intuition and visualisation purpose.
