Abelian surfaces with good reduction away from 2

Young Researchers in Algebraic Number Theory (Y-RANT) conference

Robin Visser
Mathematics Institute
University of Warwick

7 September 2023
Motivation

- Let $K$ be a number field and $S$ a finite set of places of $K$. 

Motivation

• Let $K$ be a number field and $S$ a finite set of places of $K$.

Conjecture (Mordell 1922)

Any smooth curve $C/K$ of genus at least 2 has only finitely many $K$-rational points.
Motivation

- Let $K$ be a number field and $S$ a finite set of places of $K$.

**Conjecture (Mordell 1922)**

Any smooth curve $C/K$ of genus at least 2 has only finitely many $K$-rational points.

**Conjecture (Shafarevich 1962)**

Let $g \geq 2$ be a positive integer. Then there are only finitely many $K$-isomorphism classes of smooth curves $C/K$ of genus $g$ with good reduction outside $S$. 
## Motivation

- Let $K$ be a number field and $S$ a finite set of places of $K$.

### Conjecture (Mordell 1922)

*Any smooth curve $C/K$ of genus at least 2 has only finitely many $K$-rational points.*

### Conjecture (Shafarevich 1962)

*Let $g \geq 2$ be a positive integer. Then there are only finitely many $K$-isomorphism classes of smooth curves $C/K$ of genus $g$ with good reduction outside $S$.*

### Conjecture (Shafarevich 1962)

*Let $d \geq 1$ be a positive integer. Then there are only finitely many $K$-isomorphism classes of (p.p.) abelian varieties $A/K$ of dimension $d$ with good reduction outside $S$.***
**Motivation**

- Let $K$ be a number field and $S$ a finite set of places of $K$.

Motivation

Faltings proof not fully effective (can give weak bound on number of isogeny classes)!
Motivation

Faltings proof not fully effective (can give weak bound on number of isogeny classes)!

Conjecture (Effective Shafarevich)

There exists an effectively computable constant $c_{K,d,S}$ such that, for any dimension $d$ abelian variety $A/K$ with good reduction outside $S$, we have $h_F(A) \leq c_{K,d,S}$. 

Cases for which we have effective algorithms:

- elliptic curves ($d = 1$)
- abelian varieties of GL$_2$-type (i.e. $\text{End}(A) \otimes \mathbb{Q}$ contains a degree $d$ number field)
- hyperelliptic curves
- $K = \mathbb{Q}$ and $S = \emptyset$

Even the case $d = 2$, $K = \mathbb{Q}$, $S = \{2\}$ is still an open problem!
Motivation

Faltings proof not fully effective (can give weak bound on number of isogeny classes)!

Conjecture (Effective Shafarevich)

Abelian surfaces

Problem

Classify all abelian surfaces $A/\mathbb{Q}$ with good reduction away from 2.
Abelian surfaces

Problem

Classify all abelian surfaces $A/\mathbb{Q}$ with good reduction away from 2.

If $A/\mathbb{Q}$ is a principally polarised abelian surface, then $A$ is isomorphic to one of the following three cases:

1. $A \cong \text{Jac}(C)$ where $C/\mathbb{Q}$ is smooth genus 2 curve.
2. $A \cong E_1 \times E_2$ where $E_1, E_2$ are elliptic curves over $\mathbb{Q}$.
3. $A \cong \text{Res}_{K/\mathbb{Q}} E$; the Weil restriction of an elliptic curve $E/K$ where $K$ is a quadratic number field.

Cases 2 and 3 can easily be dealt with. Case 1 seems to be hard (at least for me)!
Abelian surfaces

Problem

Classify all abelian surfaces $A/\mathbb{Q}$ with good reduction away from 2.

If $A/\mathbb{Q}$ is a principally polarised abelian surface, then $A$ is isomorphic to one of the following three cases:

1. $A \cong \text{Jac}(C)$ where $C/\mathbb{Q}$ is smooth genus 2 curve.

</tbody>
</table>

- By taking $\text{Jac}(C)$, we have examples of abelian surfaces with good reduction outside 2.

- But there are more!

- Examples of other curves $C/\mathbb{Q}$ where $\text{Jac}(C)$ good outside 2:
  - $C/\mathbb{Q}$: $y^2 = x^5 - 14x^3 + 81$ has bad reduction at $\{2, 3\}$.
  - $C/\mathbb{Q}$: $y^2 = 2x^5 - 9x^4 - 24x^3 + 22x^2 + 78x - 41$ has bad reduction at $\{2, 5\}$.
  - $C/\mathbb{Q}$: $y^2 = 2x^5 + x^4 - 16x^3 - 72x^2 + 240x + 136$ has bad reduction at $\{2, 7\}$.
  - $C/\mathbb{Q}$: $y^2 = x^5 + 478x^3 + 57122x$ has bad reduction at $\{2, 13\}$.

So far, we've found 502 examples of genus 2 curves $C/\mathbb{Q}$ such that $\text{Jac}(C)$ is good outside 2.
Genus 2 curves

From here on, we’ll focus on attempting to solve the (hopefully simpler) subproblem:

(Hopefully easier) subproblem

Classify all isogeny classes of abelian surfaces $A/\mathbb{Q}$ with good reduction away from 2 and with full rational 2-torsion (i.e. $\mathbb{Q}(A[2]) = \mathbb{Q}$).
Let $A/K$ be an abelian variety. Its $L$-function factors as an Euler product,

$$L(A/K, s) = \prod_{p\text{ prime}} L_p(A/K, N_p^{-s}).$$

where, for primes $p$ of good reduction, $L_p(A/K, T)$ is given by the characteristic polynomial of $\rho_{A,\ell}(\text{Frob}_p)$ where $\rho_{A,\ell} : \text{Gal}(K/K) \to \text{Aut}(\mathbb{Z}_\ell(T\ell(A))) \cong \text{GL}_2(\mathbb{Z}_\ell)$.

**Theorem (Faltings–Serre)**

Let $A/K$ and $B/K$ be two abelian varieties. If $L_p(A/K, s) = L_p(B/K, s)$ for some effectively computable finite set of primes $p$, then $L(A/K, s) = L(B/K, s)$.

**Theorem (Faltings–Serre–Livné)**

Let $A/Q$ and $B/Q$ be two abelian varieties with good reduction away from 2 and with full rational 2-torsion. Then if $L_p(A/Q, s) = L_p(B/Q, s)$ for each $p \in \{3, 5, 7\}$, then $A$ and $B$ are isogenous over $Q$. 

Faltings-Serre
Let $A/K$ be an abelian variety. Its $L$-function factors as an Euler product,
\[ L(A/K, s) = \prod_{\text{p prime}} L_p(A/K, Np^{-s}). \]
where, for primes $p$ of good reduction, $L_p(A/K, T)$ is given by the characteristic polynomial of $\rho_{A,\ell}(\text{Frob}_p)$ where $\rho_{A,\ell} : \text{Gal}(\overline{K}/K) \to \text{Aut}_{\mathbb{Z}_\ell}(T_{\ell}(A)) \cong \text{GL}_{2d}(\mathbb{Z}_\ell)$. 

Theorem (Faltings–Serre)
Let $A/K$ and $B/K$ be two abelian varieties. If $L_p(A/K, s) = L_p(B/K, s)$ for some effectively computable finite set of primes $p$, then $L(A/K, s) = L(B/K, s)$.

Theorem (Faltings–Serre–Livn`e)
Let $A/Q$ and $B/Q$ be two abelian varieties with good reduction away from 2 and with full rational 2-torsion. Then if $L_p(A/Q, s) = L_p(B/Q, s)$ for each $p \in \{3, 5, 7\}$, then $A$ and $B$ are isogenous over $Q$. 

Faltings-Serre
Faltings-Serre

Let $A/K$ be an abelian variety. Its $L$-function factors as an Euler product,

**Elliptic curves**

**Theorem**

Let $E/\mathbb{Q}$ be an elliptic curve with good reduction away from 2 and with full 2-torsion. Then $\mathbb{Q}(E[4]) = \mathbb{Q}(\zeta_8)$ and $\mathbb{Q}(E[8]) = \mathbb{Q}(\zeta_{16}, \sqrt[4]{2})$.

**Proof:** For any $n \geq 1$, we note the following properties for $\mathbb{Q}(E[2^n])$:

- $\mathbb{Q}(E[2^n])$ is Galois and contains $\zeta_{2^n}$.
- $\mathbb{Q}(E[2^n])$ is unramified outside 2.
- $\mathbb{Q}(E[2^n])$ is a compositum of quadratic extensions of $\mathbb{Q}(E[2^{n-1}])$. 

Elliptic curves

Theorem

Let \( E/\mathbb{Q} \) be an elliptic curve with good reduction away from 2 and with full 2-torsion. Then \( \mathbb{Q}(E[4]) = \mathbb{Q}(\zeta_8) \) and \( \mathbb{Q}(E[8]) = \mathbb{Q}(\zeta_{16}, \sqrt[4]{2}) \).

Proof: For any \( n \geq 1 \), we note the following properties for \( \mathbb{Q}(E[2^n]) \):

- \( \mathbb{Q}(E[2^n]) \) is Galois and contains \( \zeta_{2^n} \).
- \( \mathbb{Q}(E[2^n]) \) is unramified outside 2.
- \( \mathbb{Q}(E[2^n]) \) is a compositum of quadratic extensions of \( \mathbb{Q}(E[2^{n-1}]) \).
- For each odd prime \( p \) in \( \mathbb{Q}(E[2^n]) \), the Weil inequality implies

\[
2^{2n} \leq |E(\mathbb{F}_p)| \leq Np + 1 + 2\sqrt{Np}.
\]
Elliptic curves

**Theorem**

Let $E / \mathbb{Q}$ be an elliptic curve with good reduction away from 2 and with full 2-torsion. Then $\mathbb{Q}(E[4]) = \mathbb{Q}(\zeta_8)$ and $\mathbb{Q}(E[8]) = \mathbb{Q}(\zeta_{16}, \sqrt[4]{2})$

**Proof:** For any $n \geq 1$, we note the following properties for $\mathbb{Q}(E[2^n])$:

- $\mathbb{Q}(E[2^n])$ is Galois and contains $\zeta_{2^n}$.
- $\mathbb{Q}(E[2^n])$ is unramified outside 2.
- $\mathbb{Q}(E[2^n])$ is a compositum of quadratic extensions of $\mathbb{Q}(E[2^{n-1}])$.
- For each odd prime $p$ in $\mathbb{Q}(E[2^n])$, the Weil inequality implies $2^{2n} \leq |E(\mathbb{F}_p)| \leq Np + 1 + 2\sqrt{Np}$.
- $\text{Gal}(\mathbb{Q}(E[2^n]) / \mathbb{Q})$ is a subgroup of $\{ M \in \text{GL}_2(\mathbb{Z}/2^n\mathbb{Z}) : M \equiv I \pmod{2} \}$.

Classifying $E/\mathbb{Q}$ good away from 2 with full rational 2-torsion:

• As $\text{Gal}(\mathbb{Q}(\zeta_{16}, 4\sqrt{2}) \cong C_2 \times C_4$, we compute all possible embeddings of $C_2 \times C_4$ into $\{M \in \text{GL}_2(\mathbb{Z}/8\mathbb{Z}) : M \equiv I \pmod{2}\}$.

• Using that $\det(\text{Frob}_p) = p$, a brute force computer search yields $\text{tr}(\text{Frob}_3) \equiv 0$, $\text{tr}(\text{Frob}_5) \equiv 2$ or $-2$, and $\text{tr}(\text{Frob}_7) \equiv 0 \pmod{8}$.

• By the Hasse-Weil bound, this implies $\text{tr}(\text{Frob}_3) = 0$, $\text{tr}(\text{Frob}_5) = 2$ or $-2$, and $\text{tr}(\text{Frob}_7) = 0$.

• Using the Faltings–Serre–Livné criterion, this implies there are at most two isogeny classes of elliptic curves $E/\mathbb{Q}$ good away from 2 with full rational 2-torsion.

• As $E_1$, $E_2$ not isogenous, there are exactly two such isogeny classes! Computing the isogeny class over $\mathbb{Q}$ for both $E_1$ and $E_2$ gives the result!
Elliptic curves

General algorithm

A “sometimes” effective algorithm to compute isogeny classes of dimension $d$ abelian varieties $A/K$ with good reduction outside $S$:

1. Use the Faltings–Serre–Livné criterion to compute a finite set of primes $T$ for which 
   \[ \{ L_p(A/K, T) \} \quad \text{for} \quad p \in T \]
   uniquely determines $L(A/K, s)$.

2. For each $p \in T$, use the Weil inequalities to compute a finite set of possible $L$-factors $L_p(A/K, T)$.

3. For a suitable prime $\ell$ and sufficiently large $n$, compute the possible $\ell^n$-torsion fields $K(A[\ell^n])$ and thus the possible embeddings $\text{Gal}(K(A[\ell^n])/K) \to \text{GL}_d(\mathbb{Z}/\ell^n\mathbb{Z})$.

4. Compute the possible characteristic polynomials (mod $\ell^n$) to narrow down the possibilities for $L_p(A/K, T)$. For each remaining valid $L$-function $L(A/K, s)$, search for an abelian variety that has this $L$-function.

5. Hope that, for large enough $n$, the only remaining possible $L$-functions $L(A/K, s)$ correspond to explicit examples of abelian varieties already found!

One possibility is $\mathbb{Q}(\alpha)$ with minimal polynomial $x^32 - 16x^31 + 120x^30 - 528x^29 + 1356x^28 - 1232x^27 - 4768x^26 + 22128x^25 - 41324x^24 + 22672x^23 + 73368x^22 - 202720x^21 + 227588x^20 - 97728x^19 - 7248x^18 - 67344x^17 + 130936x^16 + 60384x^15 - 322288x^14 + 308080x^13 - 66076x^12 - 103424x^11 + 108920x^10 - 58864x^9 + 24084x^8 - 6448x^7 + 48x^6 + 368x^5 - 116x^4 + 64x^3 + 8x^2 + 1.
Let’s apply this to abelian surfaces:

$\dagger$ One possibility is $\mathbb{Q}(\alpha)$ with minimal polynomial $x^{32} - 16x^{31} + 120x^{30} - 528x^{29} + 1356x^{28} - 1232x^{27} - 4768x^{26} + 22128x^{25} - 41324x^{24} + 22672x^{23} + 73368x^{22} - 202720x^{21} + 227588x^{20} - 97728x^{19} - 7248x^{18} + 67344x^{17} + 130936x^{16} + 60384x^{15} - 322288x^{14} + 308080x^{13} - 66076x^{12} - 103424x^{11} + 108920x^{10} - 58864x^{9} + 24084x^{8} - 6448x^{7} + 48x^{6} + 368x^{5} + 112x^{4} + 32x^{3} + 8x^{2} + 1$. 
Results

Theorem (V. 2023)

There are exactly 3 isogeny classes of abelian surfaces $\mathbb{A}/\mathbb{Q}$ with good reduction away from 2 which contain surfaces with full rational 2-torsion. These are given by $E_1 \times E_1$, $E_1 \times E_2$ and $E_2 \times E_2$, where $E_1$, $E_2$ are the elliptic curves $E_1 : y^2 = x^3 - x$ and $E_2 : y^2 = x^3 - 4x$. 
Results

Theorem (V. 2023)

There are exactly 3 isogeny classes of abelian surfaces $A/\mathbb{Q}$ with good reduction away from 2 which contain surfaces with full rational 2-torsion. These are given by $E_1 \times E_1$, $E_1 \times E_2$ and $E_2 \times E_2$, where $E_1$, $E_2$ are the elliptic curves $E_1 : y^2 = x^3 - x$ and $E_2 : y^2 = x^3 - 4x$.

Doing a similar (albeit more tedious) computation also gives the following result:

Theorem (V. 2023)

There are exactly 23 isogeny classes of abelian surfaces $A/\mathbb{Q}$ with good reduction away from 2 which contain surfaces such that either $A[2](\mathbb{Q}) \cong (\mathbb{Z}/2\mathbb{Z})^4$ or $A[2](\mathbb{Q}) \cong (\mathbb{Z}/2\mathbb{Z})^3$. 
Thank you!
