

Hilbert Levitt - On automorphisms leaving a random subgroup invariant

(joint w/ U. Guirardel)

General question: given $H < G$, - understand automorphisms of G preserving H , denoted $\text{Aut}(G, H)$

- understand automorphisms of H extending to G

Specific question: $G = F_N$, H f.g. is $\text{Aut}(G, H)$ f.g.?

Yes, if H malnormal.

Extreme cases:

Phm (S-L) $G = F_N$, $H \neq \mathbb{Z}$, if every autom. of H extends to G , then H is a free factor.

Phm (Miller-Schupp, '87) Given H , $\exists G \supset H$ s.t. only inner automorphisms of H extend to G .

The proof is by small cancellation.

Principle ("slogan"): Fix G . If $H < G$ is sufficiently ^{f.g.} generic (or random), then very few auto's of G leave H invariant.

False in \mathbb{Z} .

Perhaps the right word is "complicated"

Thm ($G = \mathcal{L}$) $G = F_N$. Fix $p \geq 1$. Pick g_1, \dots, g_p randomly independently in the ball of radius n .
 $H = \langle g_1, \dots, g_p \rangle$ ← i.e. generically

With probability $\rightarrow 1$ as $n \rightarrow \infty$, all auto's of G preserving H are conjugations by elements of H .

Main ingredient: peak reduction (Whitehead): Whitehead auto's generate $\text{Aut}(F_N)$ very nicely.

Lemma (Kapovich-Schupp-Spivrain, '06)

A random cyclically reduced word g has minimal length in its $\text{Aut}(F_N)$ -orbit [hence, g has a small stabilizer...].

Idea of proof: suffices to show certain Whitehead auto's increase length of g .

example where length decreases: F_2 , $\alpha: \begin{matrix} a \rightarrow a \\ b \rightarrow ba \end{matrix}$

$$\underbrace{\underbrace{b a b a^{-1}}_{+1 \quad -1} \underbrace{b a^{-1} b b a^{-1}}_{-1 \quad +1 \quad -1}}_g \xrightarrow{\alpha} \underbrace{b a a b b b a b}_8$$

g random \Rightarrow frequencies of $\underbrace{b a}_\uparrow, \underbrace{b b}_\uparrow, \underbrace{b a^{-1}}_\downarrow$ are \sim same

Thm ($\mathcal{H} = \mathcal{L}$) G hyperbolic relative to slender subgroups $p \geq 1$, g_1^n, \dots, g_p^n given by random walks on G . $H = \langle g_1^n, \dots, g_p^n \rangle$. With probability $\rightarrow 1$ as $n \rightarrow \infty$, {conjugation by elements of H } has finite index in $\text{Aut}(G, H)$

2-ingredients:

- Black box: (Maher-Histo) $G \curvearrowright T$ acylindrically generically H is free, quasiconvex, malnormal, acts freely on T , ...
tree
- Relation between automorphisms and splittings
Paulin-type theorem: if the index is infinite, then G splits relative to g over a slender group.
 $P=1, H=\langle g \rangle$

Second Principle: Fix G . If g is generic, it is universally hyperbolic. There is no splitting of G relative to g .

False in F_N : $F_N \rightarrow \mathbb{Z}$ g is elliptic in a splitting
 $g \rightarrow 0$ over some F_s .

Thm (S- α) G hyperbolic relative to slender groups g generic $\Rightarrow G$ has no splitting over a slender subgroup relative to g .

Thm $G = F_N$, $g \in G$ cyclically reduced, contains all words of length L . Then F_N does not split relative to g over a subgroup F_s if $s \leq (N-1)(L-2)$

Example: $L=2$ g contains all words of length 2
 $\Rightarrow g \neq$ proper free factor (Whitehead)

Ex: $L=3$, Cashen-Manning: $g \in F_N$, g contains all 3-words, F_N has a cyclic splitting rel g .

Proof of Cashen-Manning: $G \cong T$ with cyclic edge stabilizers. Show g hyperbolic in T .

Fix equivariant $f: \text{Cay} \rightarrow T$
vertex \mapsto vertex

$f^{-1}(m)$ remains at distance $\leq R$ from A_u
 $R=2$, below purple line.

Components of $\text{Cay} \setminus \text{purple strip}$ are colored red/blue

$\text{Cay}(F_N)$ rooted at axis A_u

Lemma: If A_g (axis in Cay) has ends of different colors blue/red, then g hyperbolic in T .

Proof: If not, g fixes a point. $y = f(x)$, $gy = f(gx)$ are blue. g fixes edges containing m : $\forall n \in \mathbb{Z}$, $g^n y, g^n x$ are blue, so A_g has no red end. \checkmark

Try to push coloring all the way to A_u .

failure:

ab^{-1} appears in g , so some conjugate g' of g has axis $\succ ee'$

lemma $\Rightarrow g'$, and hence g , is hyp. in T .

success:

A_u

$ee'e''$ represents a word of length 3.
