

Closed geodesics on certain surfaces

Pierre Vidotto (Nantes)

January 26, 2016

Let S be a surface with negative curvature. Denote by $N(R)$ the number of closed geodesics on S with length smaller than R . We will investigate an equivalent to $N(R)$ for certain surfaces S whose Bowen-Margulis measure is infinite. We will first define all notions used through the talk and then give ideas of the proof.
