MATHS AND PHYSICS

UNDERGRADUATE STUDY
2024/25

WARWICK
THE UNIVERSITY OF WARWICK
Mathematics and physics are a great combination to study at university, and provide the basis for a stimulating and enjoyable education.

Mathematics and physics are complementary subjects. Often, a way of thinking developed in one discipline leads to new insights into the other. The advances in the mathematical theory of dynamical systems and chaos are an example. Ideas from the theory are now applied in the modelling of physical systems such as the atmosphere, lasers and other complex systems.

In both subjects the emphasis is on learning how to recognise the surprising and how to reason. So, although the joint degree is the natural route into theoretical physics, the skills it teaches are universal and can lead to many different careers. Our former students have gone on to work in industry and in professions such as business, journalism and the financial sector.

There are two variants of the degree course: the three-year BSc and the four-year MMathPhys. You need to decide by the end of your second year which degree to aim for. BSc courses should be seen as part of a general rounded education, which should leave you numerate, articulate and employable. The four-year course should appeal most to you if you intend to make direct use of your knowledge of mathematics and physics after you graduate.

James Lloyd-Hughes
Head of Undergraduate Admissions
The Warwick joint degree course is among the best established in the country and the course includes a number of modules from both contributing departments designed specifically for joint degree students. Each year around 85 students start on this course.

In the first year you take essential (core) modules in both mathematics and physics.

In the second and third years, there is considerable freedom to choose modules. By then you will have a good idea of your main interests and be well placed to decide which areas of mathematics and physics to study in greater depth. In effect you design your own degree. Some modules may also be taken from outside of both mathematics and physics.

We encourage you not only to consider the ‘obvious’ outside modules, but also modules introducing secondary school teaching or a modern language.

The optional fourth year continues to cover the main areas of mathematics and physics. You can continue to study a broad spectrum of topics within both subjects. Alternatively, you may choose to concentrate on one or two areas. This can give time to take in and reflect on some of the recent developments in these areas.

Our research is strong in a number of branches of mathematics and physics, and we are well placed to offer authoritative and coherent accounts of those recent developments likely to be of most interest to you as a joint degree student.

Most of the 1st year physics modules deal with familiar subjects, such as Newtonian mechanics and thermodynamics. The possible exceptions are the material on relativity and the module Quantum Phenomena. These deal with the breakdown of Newtonian physics at velocities close to the speed of light and at atomic length scales.

Computers are increasingly important in all of mathematics and theoretical physics. The Programming Workshop teaches Python programming and how to solve numerically the mathematical models of physical systems.

Overleaf is a typical first year timetable. We plan to deliver a timetable similar to this in 2024/25.
The timetable for the first five weeks of the first year should give an idea of the typical weekly workload of lectures and tutorials.

The tutorials involve smaller groups and a lecturer or postgraduate student. The idea is to work through examples sheets handed out in the lectures and to discuss any problems with the material. Wednesday afternoons are kept free of classes, as Wednesday is the main day for university activities such as sport, drama and music.

These core modules complete the treatment of basic material assumed by subsequent modules. There is then a broad range of modules covering all the main areas of mathematics and physics from which you choose a selection. Currently the core modules are:

**Maths**
- Mathematical Analysis III
- Methods of Mathematical Physics
- Metric Spaces
- Partial Differential Equations

**Physics**
- Hamiltonian and Fluid Mechanics
- Quantum Mechanics and its Applications
- Statistical Mechanics
- Electromagnetic Theory and Optics

You choose at least four further modules with at least one from Maths. The lists may change over time. Currently they are:

**Maths**
- Mathematical Methods and Modelling III
- Multilinear Algebra
- Multivariable Analysis

**Physics**
- Computational Physics
- Environmental Physics

**Outside Options**
- Interdisciplinary modules from WBS (Warwick Business School), the Language Centre (Arabic, Chinese, French, German, Italian, Japanese, Portuguese, Russian and Spanish), and the Centre for Education Studies (Introduction to Secondary School Teaching).

In the second year there are core modules taken by everybody.

**Mathematical Analysis III** extends ideas learned in the first year and introduces the analysis of functions of more than one variable and of complex variables. The module Metric Spaces generalises concepts like continuity and convergence to more general spaces and provides a basis for many of the tools used in mathematical physics.

The field of fluids is one of the richest in applied mathematics and physics. Although motions of fluids – water and air are two we meet every day – are complicated, many flow patterns have simple and intuitively appealing explanations. You will learn, for example, why power lines whistle in the wind and why aeroplanes use their engines just before landing.

**Second Year**

**First Year timetable (weeks 1-5) - mornings**

<table>

THIRD Year
BSc

In the third year of the BSc you take a module on Communicating Science. You select at least seven modules from the lists of options, which currently are:

**Maths**
Functional Analysis, Complex Analysis, Fluid Dynamics, Measure Theory, Theory of PDEs, Topics in Mathematical Biology

**Physics**

**Outside Options**
Modules from WBS, the Language Centre and other departments.

You can choose to carry out a research-style project worth roughly 30% of the year’s credit. A project brings you into contact with a research group, where you work with and alongside postgraduate students and research fellows. It can give fresh insight into the way research scientists work and think.

THIRD Year
MMathPhys

Opting for the MMathPhys allows you more time to explore the implications of what you have already learnt.

The third year, like the second year, consists of compulsory modules covering the material which will be assumed by many of the fourth year modules, and modules chosen from lists of options. The core modules are:

**Physics**
Quantum Physics of Atoms, Kinetic Theory, Electrodynamics

**Mathematics**
Fluid Dynamics

There is a Laboratory and Skills module. As a member of a group of three students, you complete an experiment and a computer-based simulation of a physical system.

You present your results both orally and in an extended written report.

Typically, you take a further six modules from the options listed for the third year of the BSc.

“The overlap – using cool maths to explain the phenomena we see around us – is what I am particularly interested in. I don’t just want to be told the answers though; being able to learn more deeply, and fully understand these problems is much more important to me. It has enabled me to develop so many useful skills, alongside learning more about my subjects.”

Beth Kynman
Civil Servant
2019 MMathPhys graduate
The project work gives you experience of working more independently. This experience should be valuable to you in your subsequent career, whether you choose to work as a scientist or not, and can help you when you are making decisions about possible careers.

You choose at least five of the following modules choosing at least two from the list of maths modules and two from the list of physics modules. The lists are currently:

**Mathematics**
- Advanced Partial Differential Equations
- Dynamical Systems
- Fourier Analysis, Linear Analysis
- Quantum Mechanics: Basic Principles and Probabilistic Methods
- Statistical Mechanics, Topics in Mathematical Biology
- Modules from the third year lists can also be chosen.

**Physics**
- Advanced Quantum Theory

You may also take modules from the third year which you have not already taken.

**Outside Options**
There is no formal list of outside options. However, you can follow modules from outside the department provided that the timetable permits this.

### FOURTH Year

During the fourth year you join one of the research groups and work with a partner on a research-style project.

### INTERCALATED Year

You may also extend the BSc degree by inserting an extra year (usually) between your second and what would otherwise be your third year.

You would spend this ‘intercalated’ year studying at a foreign university or working in a research laboratory.
FIND OUT MORE

HOW TO APPLY
Applications are made through UCAS ucas.com

If you are made and accept an offer, and meet any outstanding conditions, we will confirm your place and look forward to warmly welcoming you at the start of your life here at Warwick. For more detailed information about how we process applications please visit: warwick.ac.uk/study/undergraduate/apply

OVERSEAS APPLICANTS
At Warwick, we welcome applications from across the globe, and have dedicated teams available to advise and support, as well as a global network of Agents and Representatives. For more information on applying from your country see: warwick.ac.uk/study/international

STUDENT FEES AND FUNDING
We want to ensure that, wherever possible, financial circumstances do not become a barrier to studying at Warwick. We provide extra financial support for qualifying students from lower income families. warwick.ac.uk/studentfunding

ACCOMMODATION
Warwick Accommodation manages over 7400 self-catering residences on campus. Living on campus in your first year gives you the opportunity to meet people and form new friendships whilst never being more than a short distance from your lectures or the amazing facilities campus has to offer. At Warwick, you’ll enjoy the freedom of independent living alongside your fellow students but with the security of knowing you’re surrounded by people who can support you. For more information visit: warwick.ac.uk/accommodation

DISCOVER MORE
To find out more about the University, including opportunities to visit and engage with your department of choice, visit: warwick.ac.uk/undergraduate/visits

This course information was accurate at the time of publication (June, 2023). While the University tries to ensure that the information is accurate, it does not guarantee that this is the case. The University may need to make changes including to the course content, syllabus, delivery, methods of assessment, or to comply with external accrediting or reviewing bodies. It is therefore important that you revisit the relevant course website before you apply and when you accept an offer to ensure you are viewing the most up to date information. This information should not be construed as an offer and nor does it create a contract or other legally binding relationship between the University and you or a third party.
