Welcome to the Department of Physics at the University of Warwick.

Physics is a practical subject full of beautiful ideas. If you study physics as an undergraduate with us, you will be exploring deep questions about the nature of the Universe and developing many useful skills.

There are two variants of the degree course: the three-year BSc and the four-year MPhys. BSc courses should be seen as part of a general rounded education, which should leave you numerate, articulate and employable.

The four-year course should appeal most to you, if you intend to make direct use of your knowledge of physics after you graduate.

Neil Wilson
Head of Undergraduate Admissions
Our courses are designed to challenge you and to help you to develop important intellectual and marketable skills. The courses are built around a flexible curriculum, which, after the first year, allows you to choose a sizeable proportion of your modules from lists of options.

You might choose to concentrate on particular areas or try to keep your studies as broad as possible. The need to make choices about which modules to take will encourage you to think about physics in the context of science as a whole, and to develop your own ideas about the relative importance of the various strands within the discipline.

The structure of the course reflects the structure of the subject. You will take core lecture modules (concentrated mainly in the first two years), which introduce and develop the fundamental concepts, such as those of quantum theory and electromagnetism, and cover the mathematics used in physics. The skills training helps you to develop important experimental skills and more general skills training in computing, communication and problem solving.

Modules chosen from lists of options are largely concerned with seeing how the fundamental concepts can explain the phenomena we observe. Examples include the light emitted and absorbed by stellar matter, and the response of the liquids, solids and gases, which we meet on a daily basis, to the mechanical, electrical and thermal forces acting on them.

We have research strengths in a number of branches of physics and can offer authoritative and coherent accounts of those recent developments likely to be of most interest to you. In the third and fourth years, you will benefit from interacting with our research groups when you undertake research-style projects.

A feature of Warwick is that Departments keep many of their modules open to students from other disciplines. These are available to you under our ‘unusual option’ scheme. We encourage you to explore outside the field of physics. As well as exposing you to alternative ways of thinking, outside modules can help set physics into the context of science as a whole. You can opt to take modules in related sciences or from outside of science altogether. There are modules in business studies, modern languages, philosophy, and other areas.

You can opt to take modules in related sciences or from outside of science altogether. There are modules in business studies, modern languages, philosophy, and other areas.
**TEACHING**

We provide a supportive and friendly environment in which to study. You will learn not just from the lectures and laboratories but also from interacting with others on the course, research students and your friends from outside physics.

**Lectures**

Lectures are an effective way of presenting information to a large group of students. The 50-minute lectures introduce the material, which you then study further on your own. The core modules in the first year are supported by weekly classes, at which you and your fellow students meet in small groups with a member of the research staff or a postgraduate student. These classes are there for you to discuss any problems of understanding, which arise from the lectures, and to go through your written work for the module. They also provide an important indirect route back to the lecturer for your comments about the lectures.

**Laboratories**

The laboratory modules teach the essential skills of experimental physics. In broad terms every scientist needs to know how to carry out an investigation, assess its significance and report the results clearly and concisely. As well as developing the techniques of experimental physics, time spent in the laboratory helps illustrate the theoretical aspects of the subject presented in the lectures.

**Projects**

In your final year, you will work on a research-style project. This is often a very satisfying part of the degree course. It gives you the opportunity to develop your own ideas in a particular field of interest. Usually you will work in a pair, within one of our research groups and alongside postgraduate students and other members of staff. Sometimes the project work can involve interacting with people from other disciplines or from industry.

**Personal Tutor**

Your personal tutor will be an important contact with the academic staff in the Department. During the first two years, you will meet your personal tutor at weekly tutorials in the first two terms to discuss coursework and to reflect on your studies and planning for future years. Normally your tutor would also be the first person to see about any problem. In the case of more serious worries, your personal tutor will direct you to the University’s Dean of Students, who runs a team of professional counsellors and the student support services.

**Assessment**

Your performance is assessed on the basis of written examinations and coursework. In any year about 30% of the overall mark is assigned to coursework. Coursework components of a degree course include problems set in association with lecture modules, laboratory and computational projects, and modules assessed on the basis of one or more reports.

**Feedback**

Our staff and student representatives meet regularly on a Staff Student Liaison Committee (SSLC) to discuss any changes and improvements, which can be made to the teaching.
In the first year, you take essential (core) modules and choose at least one more module from a list of options. The first year is currently:

Core
Mathematics for Physicists (60 Lectures), Classical Mechanics and Relativity (30L), Physics Foundations (30L), Electricity and Magnetism (30L), Programming Workshop (15L), Quantum Phenomena (15L).

There is a key skills module, which everybody takes. This involves conducting experiments in the laboratory, as well as computing and presentation work.

Options
You also choose at least one of: Introduction to Astronomy (15L), Particle Physics (15L).

Physics involves observing nature and identifying the universal laws, which govern its behaviour. Classical mechanics illustrates this well. The laws of mechanics were deduced by Newton after studying observations of planetary motion. They apply to nearly all systems familiar from everyday life as well as many of the phenomena observed in stars and the other planets, some of which are also discussed in the module on astronomy.

The modules on relativity and quantum theory deal with the breakdown of Newtonian mechanics at speeds close to the speed of light and at short (atomic) distances. Other first year physics modules treat material, which should in part be familiar from A level (electricity, magnetism and heat), but are able to illustrate it with more interesting examples and to bring out better the unifying concepts.

To give an impression of the weekly workload of lectures and tutorials, please see overleaf a typical timetable for the first five weeks of the first year. Wednesday afternoons are generally kept free of teaching as this is the main day for university activities such as sport, drama and music.
SECOND Year

In the second and third years there is considerable freedom to choose modules. By now you will have a good idea of your main interests and be well placed to decide which areas to study in greater depth. In effect you design your own degree.

The current second year modules are:

Core
Electromagnetic Theory and Optics, Mathematical Methods for Physics, Quantum Mechanics and its Applications, Thermal Physics II. You continue to work in the laboratory as part of the Physics Skills Programme. You also complete library research, data analysis and writing exercises.

You choose about a further six modules (not all modules are the same length) from lists of options. Currently these are:

Physics

Outside Options
Modules from Warwick Business School; the Language Centre (Arabic, Chinese, French, German, Italian, Japanese, Portuguese, Russian and Spanish); and the Centre for Education Studies (Introduction to Secondary School Teaching).

THIRD Year

BSc

If you are on the three-year BSc course, you will work in a pair on a project chosen from a list of titles and supervised by a member of staff.

The project brings you into contact with a research group where you work alongside research students, technicians and research fellows. The project can give you insights into how research scientists work and think.

You take the modules Quantum Physics of Atoms and Communicating Science. You select further modules from the representative lists below, where we have grouped the physics modules together according to subject matter. Although there is no formal requirement to select a set number of modules from any one list, it is usually better to concentrate on two or three areas.

Astrophysics
Black Holes White Dwarfs and Neutron Stars, Galaxies and Cosmology.

Classical Physics

Quantum Phenomena
Condensed Matter Physics, Nuclear Physics, The Standard Model.

Interdisciplinary

Outside Options
Modules from Warwick Business School, the Language Centre (Arabic, Chinese, French, German, Italian, Japanese, Portuguese, Russian and Spanish), and the Centre for Education Studies (Introduction to Secondary School Teaching).

Alex Malins
Staff Scientist, Japan Atomic Energy Agency
BSc Maths and Physics graduate 2007

“Since childhood I had always maintained an interest in energy and electricity, and this was piqued both by the excellent Second Year module on the Physics of Electrical Power Generation at Warwick and through reading Sustainable Energy without Hot Air.

I now work as a staff scientist at Japan Atomic Energy Agency on various radiation and environmental analyses related to the recovery from the 2011 Fukushima Daiichi meltdowns.”

THIRD Year

MPhys

Opting for the MPhys allows you more time to explore the implications of what you have already learnt. This is the idea behind the Group Project and the MPhys laboratory.

The Group Project and the laboratory are designed to give experience of those working methods which cannot easily be taught in lecture halls. For the Group Project, you work in groups of five or six to study an area of physics and write a review of the current status of the area.

In the laboratory, you complete some longer and more involved experiments than are possible in the first and second year teaching laboratories. The rest of the third year consists of a core of compulsory modules covering material which will be assumed by many of the fourth year modules, and modules chosen from lists of options.

Core
Quantum Physics of Atoms, Electrodynamics, Mathematical Methods III.

You take further modules from the options listed for the third year of the BSc but must choose at least two of Galaxies and Cosmology, Condensed Matter Physics, The Standard Model and Plasma Electrodynamics.
The project work gives experience of working more independently. This experience should be valuable in your future career, whether you work as a scientist or not, and can help you make more informed career choices.

You will also take around twelve (not all modules are the same length) of the following modules with at least eight chosen from the list of physics modules. Current lists are:

**Astrophysics**
The Distant Universe, Planets Exo-Planets and Life.

**Classical Physics**

**Computing**
High Performance Computing in Physics.

**Condensed Matter**
Condensed Matter Physics II, Structure and Dynamics of Solids.

**Quantum Theory**
Gauge Theories of Particle Physics, Relativistic Quantum Mechanics, Quantum Computing and Simulation.

**Elementary Particle Physics**
Advanced Particle Physics, Neutrino Physics.

**Outside Options**
There is no formal list of outside options. However, you can follow modules from outside the department provided that the timetable permits this.

**FOURTH Year**
During the fourth year, you join one of the research groups in the department (experimental or theoretical) and work in pairs on a research project.

**PHYSICS WITH BUSINESS STUDIES**
**FN31 BSc**

The departments at Warwick have a tradition of offering as many of their modules as possible to students from other disciplines. However, for those with a particular interest in Business Studies there is the Physics with Business Studies degree.

The course is designed for students who enjoy physics but wish also to develop an interest in management and business. The Warwick Business School (WBS), which is a leading Business School in the country, has pioneered the teaching of management science to undergraduates at British universities.

During the first two years of the degree, you are based in the Department of Physics. You take the core physics modules and an introductory module on business. You would normally take more outside modules including perhaps a foreign language module.

In the third year you transfer to WBS, where you choose four modules from the lists of those available. Each module lasts the whole year and carries 25% of the final year credit.
"I studied the MPhys course at Warwick and ended up extending my final year project into a PhD. I’m now a Patent Attorney for Withers & Rogers LLP. Broadly speaking, my role is to help inventors secure effective legal protection for new and innovative technology.

In a typical day, I work on multiples cases across a crazy range of technology - from jet engines to software, satellites to artificial heart valves. My interest in this area came about during my PhD, whilst I worked with Warwick Ventures to patent a novel semiconductor device. It was Warwick that first exposed me to the eclectic mix of science and technology that allows me to work in such a varied and dynamic environment."

Dr James Richardson-Bullock
Associate Patent Attorney
Withers & Rogers LLP

The Physics COMMUNITY

Apart from teaching, the University’s main role is to carry out research.

Warwick is consistently ranked amongst the top universities for research in the UK and the Department of Physics is itself rated highly in the Research Excellence Framework 2014.

The interaction with the research community within the Department brings you into contact with the latest innovations and ideas and is particularly valuable in your final year when you carry out project work.

The Department of Physics has a number of areas of research excellence including: astrophysics, the physics of condensed matter, elementary particle physics, plasma physics and theoretical physics.

Looking AHEAD

After graduation 53% of our graduates move directly into employment while 44% go on to further study usually in physics, mathematics or engineering.*

The most popular areas of employment include computing and consultancy, accounting and financial work, public administration, engineering and the retail sector.

*Destination of Leavers from Higher Education survey of 2016/17 graduates six months after graduating; all Physics undergraduate students who are available to work.
FIND OUT MORE

HOW TO APPLY
Applications are made through UCAS ucas.com
If you are made and accept an offer, and meet all conditions we will confirm your place and look forward to warmly welcoming you at the start of your life here at Warwick.

For more detailed information about how we process applications please visit: warwick.ac.uk/study/undergraduate/apply

OVERSEAS APPLICANTS
At Warwick, we welcome applications from across the globe, and have dedicated teams available to advise and support, as well as a global network of Agents and Representatives. For more information on applying from your country see: warwick.ac.uk/io

STUDENT FEES AND FUNDING
We want to ensure that, wherever possible, financial circumstances do not become a barrier to studying at Warwick. We provide extra financial support for qualifying students from lower income families. warwick.ac.uk/studentfunding

ACCOMMODATION
Warwick Accommodation has around 7000 rooms across a range of well-managed, self-catering residences. We also have an excellent network of support staff in the Residential Life Team. warwick.ac.uk/accommodation

DISCOVER MORE
To find out more about the University, including opportunities to visit and engage with your department of choice, visit warwick.ac.uk/undergraduate/visits

Disclaimer: This course information was accurate at the time of publication (May 2020). Our course and module content and schedule is continually reviewed and updated to reflect the latest research expertise at Warwick, so it is therefore very important that you check the relevant course website for the latest information before you apply and when you accept an offer. For full terms and conditions, please visit warwick.ac.uk/ugtermsandconditions
