

# Market Externalities of Large Unemployment Insurance Extensions

Rafael Lalive, Camille Landais & Josef Zweimuller

PEUK-Warwick  
June 18, 2013

# Motivation:

## What is the effect of increasing generosity of UI on labor market outcomes?

- We  $\approx$  know what micro effect  $\epsilon^m$  is
  - ▶ In *theory*, increase in UI unambiguously increase U duration
  - ▶ *Empirically*, large number of well-identified micro estimates
- What about macro effect  $\epsilon^M$ ?
  - ▶ In *theory*, large literature on equilibrium search & matching, but anything goes:  $\epsilon^m \begin{matrix} \geq \\ < \end{matrix} \epsilon^M$
  - ▶ *Empirically*, difficulty of estimating G-E effects of UI and to analyze how micro and macro estimates differ

# Market externalities of UI:

- Market externality:
  - ▶ UI induced variations in the search effort of some unemployed affect job finding probability of other unemployed in the same labor market
- Market externality  $\approx \epsilon^m - \epsilon^M$
- Sign and size of  $\epsilon^m - \epsilon^M$  critical to determine optimal UI level (LMS ['13])

# This paper:

- Regional Extended Benefit Program (REBP): Large extensions of UI in Austria
  - ▶ Increase from 52 to 209 weeks for eligible 50+ in specific regions
  - ▶ Unique quasi-experimental setting to identify externalities
  - ▶ Strong evidence of positive effects of REBP on untreated workers in treated labor markets
- Discuss how evidence relates to different search & matching models:
  - ▶ Evidence refutes predictions of flexible wage & linear technology models
  - ▶ Evidence in line with job-rationing models

# Related literature:

- Empirical literature on identification of spillovers of policy interventions
  - ▶ General literature on spillovers: Duflo & Saez (2003)
  - ▶ Spillovers of active labor market policies: Crepon & al. (2012), Ferracci & al. (2010), Blundell, & al. (2004).
  - ▶ Spillovers of UI: Levine (1993)
- Literature on optimal UI:
  - ▶ Direct continuity of LMS (2012)

# REBP reform in Austria

- Large UI benefit extension program enacted in Austria
  - ▶ 209 weeks instead of 52 weeks
- Eligibility requirements:
  - ▶ Age: more than 50
  - ▶ Reside in selected regions at least 6 months before becoming unemployed
  - ▶ At least 15 years of continuous work history in the past 25 years
  - ▶ Spell beginning between June 1988 and Dec 1993

**Figure 1 : Austrian regions by REBP treatment status**

With Extended Benefits = Shaded  
Without Extended Benefits = White

# Data:

- Universe of UI spells in Austria from 1980 to 2010:
  - ▶ Info on age, residence, education, marital status, etc...
- Universe of social security data in Austria from 1949 to 2010:
  - ▶ Info on each employment spell
  - ▶ Compute experience in past 25 years
  - ▶ Merge with UI data to determine REBP eligibility
  - ▶ Info on wages, industry, tenure,

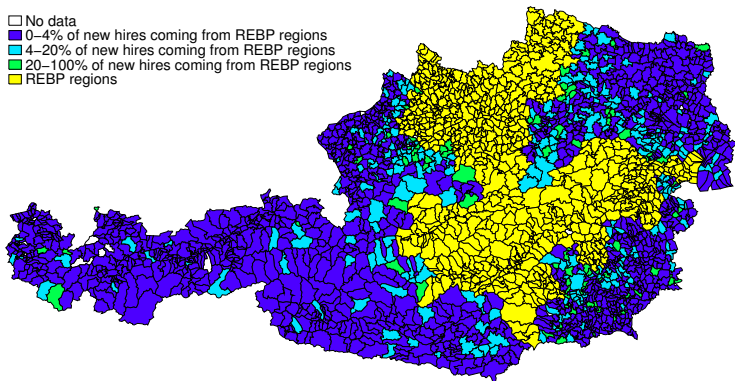

# Empirical strategy:

- **First (ATT):** Compare treated workers in treated regions and untreated regions before/during/after
- **Then (AE):** Compare untreated workers in treated and untreated regions before/during/after
- Identification assumptions:
  - ▶ Treated and untreated regions are somehow isolated
  - ▶ Unobserved differences between treated and untreated workers fixed over time
  - ▶ Unobserved differences between labor markets are fixed over time

# Sample selection:

- Endogeneity of choice of REBP regions:
  - ▶ Regions are not selected at random: restructuring of steel sector
  - ▶ Remove all steel sector workers (at most 15% of unemployed in treated regions), and all workers in related industries
- Geographical spillovers:
  - ▶ We exclude non-treated counties that are highly integrated to REBP counties

**Figure 2 : Local labor markets integration:** Fraction of new hires from REBP regions in total number of new hires by county

*Sample:* male age 50 to 54 in non steel-related industries, 1980-1987.

Table 1 : SUMMARY STATISTICS:

	(1)	(2)	(3)	(4)
<b>A. All workers</b>				
<b>treated vs untreated counties before 1988</b>				
	M=0	M=1	Difference	p-value
Age	51.9	51.9	0	.366
U duration	18.7	19.4	-.7	.12
Non employment duration	31.7	29.9	1.8	.018
Fraction spells > 100 wks	.033	.039	-.006	.023
Fraction spells > 26 wks	.135	.122	.013	.016
Real wage before spell	52.1	50.5	1.6	0
Real wage after spell	51.8	50.8	1.1	0
White Collar	.063	.035	.028	0
Fraction not in construction	.38	.369	.011	.148
<b>B. Treated workers vs untreated workers</b>				
<b>in treated counties before 1988</b>				
	T=0	T=1	Difference	p-value
Age	51.8	51.9	-.1	.181
Experience	4089.365	8292.634	-4203.269	0
U duration	16.3	19.6	-3.3	.025
Non employment duration	52.5	28	24.5	0
Fraction spells > 100 wks	.018	.041	-.023	.022
Fraction spells > 26 wks	.091	.124	-.033	.056
Real wage before spell	47.3	50.8	-3.6	0
Real wag after spell	47.4	51	-3.6	0
White Collar	.01	.037	-.027	.006
Fraction not in construction	.345	.371	-.026	.307

Figure 3 : **Difference in U duration between REBP and non REBP regions:** male 50-54 with more than 15 years of experience

Figure 4 : **Difference in U duration between REBP and non REBP regions:** male 50-54 with less than 15 years of experience

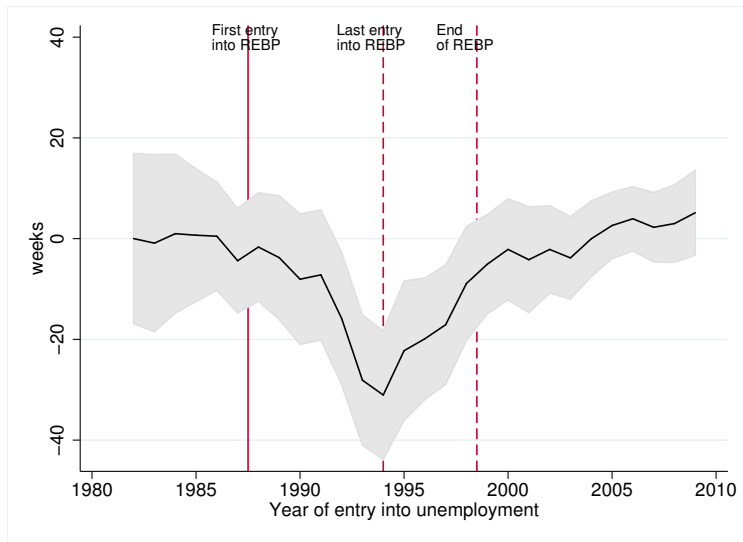

Figure 5 : Difference in in hazard rates between REBP and non REBP regions: male 50-54 with **more** than 15 years of experience

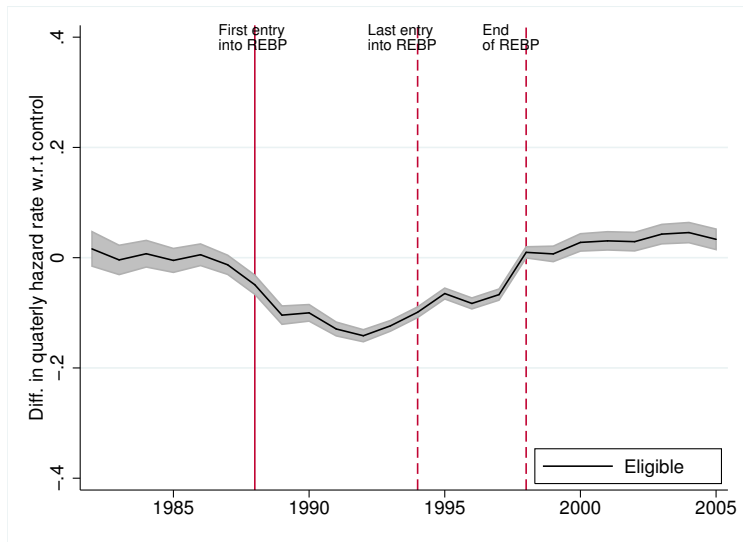

Figure 6 : Difference in hazard rates between REBP and non REBP regions: male 50-54

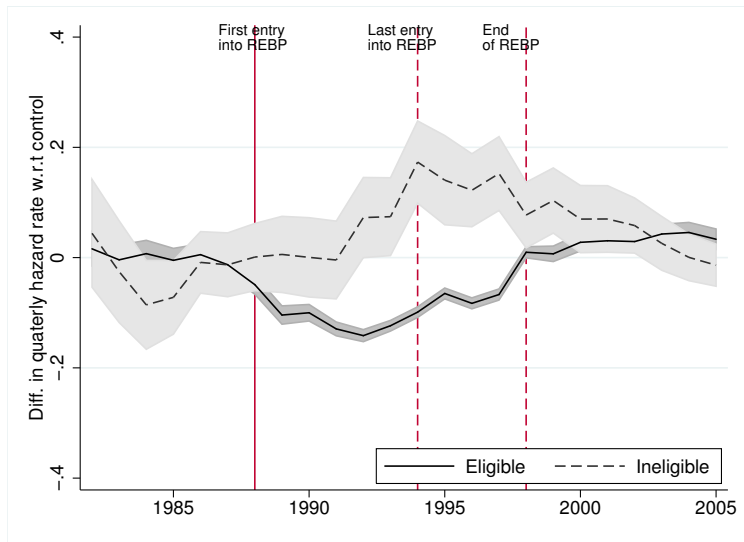

Figure 7 : Relationship between previous work experience and unemployment duration: male 50-54, **Before and after REBP**

Figure 8 : Relationship between previous work experience and unemployment duration: male 50-54, **during REBP**

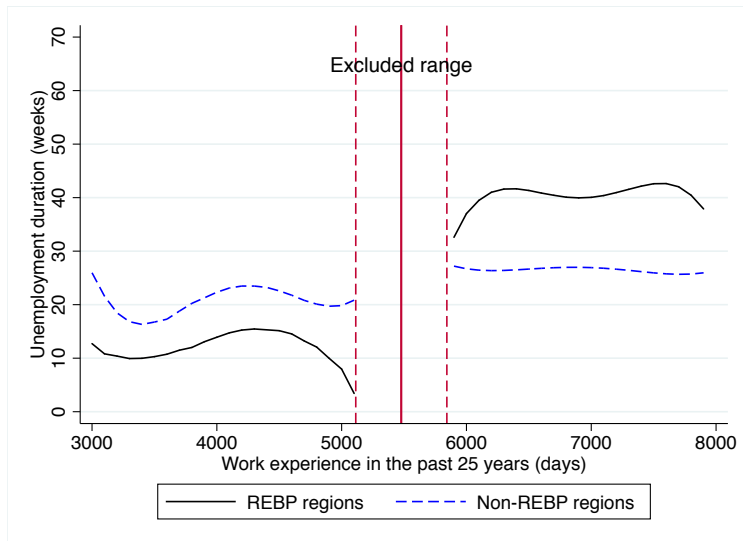

Figure 9 : Relationship between age and non-employment duration: male 50-54, **Before and after REBP**

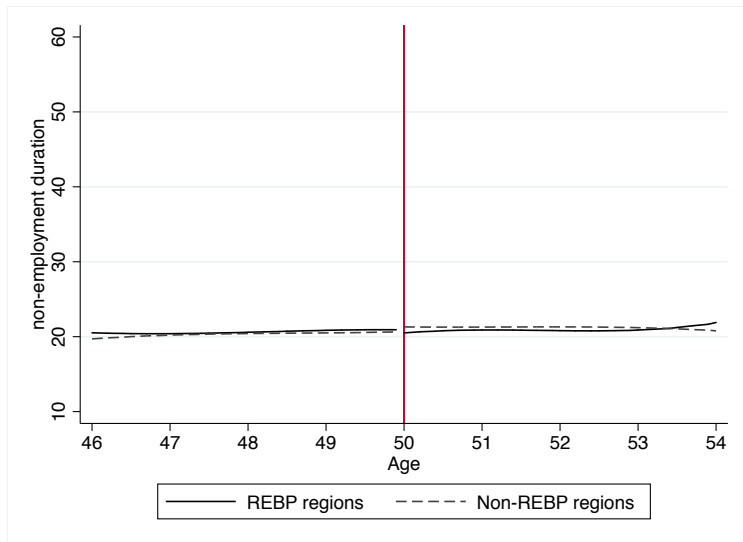

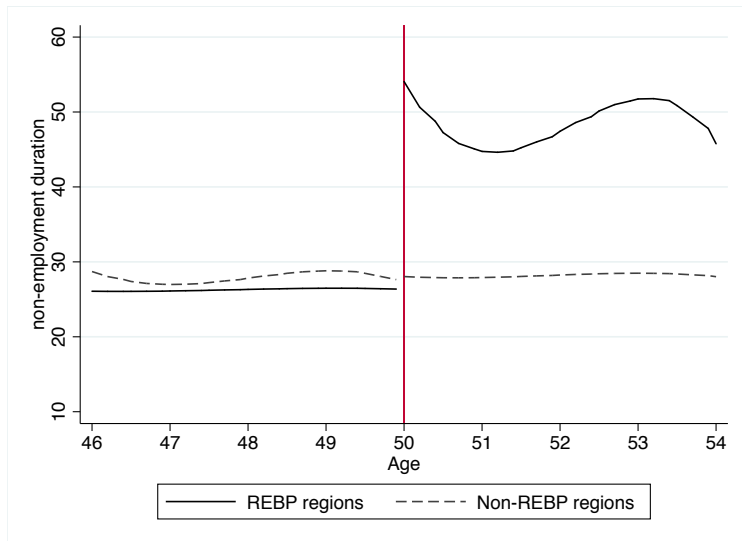

Figure 10 : Relationship between age and non-employment duration: male 50-54, **during REBP**

# Baseline specifications:

$$Y_{irt} = \alpha + \overbrace{\beta_0 \cdot Z_{irt} \cdot R_r \cdot T_t}^{\text{Effect of REBP on treated}} + \overbrace{\gamma_0 \cdot (1 - Z_{irt}) \cdot R_r \cdot T_t}^{\text{Effect of REBP on non-treated}} \\ + \eta_0 R_r + \eta_1 B_{irt} + \eta_2 B_{irt} \cdot R_r \\ + \sum \nu_t + \sum \eta_3 B_{irt} \cdot \iota_t + X'_{it} \rho + \varepsilon_{irt}$$

- $R_r$ : indicator for residing in REBP region
- $T_t$ : indicator for spell starting btw June 1988 and Dec 1997
- $B_{irt} = \mathbb{1}[exp > 15]$ : indicator for more than 15 yrs of exp
- $Z_{irt} = B_{irt} \cdot \tilde{T}_t$ : indicator for being eligible to REBP extensions

# Potential confounders:

- Confounder 1: **region-specific shocks**
  - ▶ REBP regions experience differential shock on labor market conditions at the time REBP was implemented
  - ▶ If anything, we expect negative shock if REBP regions endogenously selected
- Confounder 2: **selection**
  - ▶ Self-selection into unemployment affected by the reform for non-treated group in treated counties
  - ▶ If anything, bias likely to attenuate estimate of spillover effect on non-treated

**Table 5 :** Region-specific shocks: using unemployed age 30 to 40 in REBP regions as a control

# Theoretical implications

- Our main findings
  - ▶ Positive externalities of UI extensions on non-treated unemployed in the same labor markets
  - ▶ Externalities still visible in the middle-run ( $\approx 4$  years)
  - ▶ Reemployment wages not very sensitive to outside options of workers
- Theoretical implications for search and matching models
  - ▶ Labor market tightness  $\theta$  increases in equilibrium when labor supply decreases
- Policy implications for optimal UI
  - ▶ UI extensions less distortionary than previously thought

# Labor Market with Matching Frictions

- $u$  unemployed workers:
  - ▶ Exert search effort  $e$
  - ▶  $e$  function of UI benefits  $B$
- $v$  vacancies.
- Number of matches:  $m(e \cdot u, v) = \omega_m \cdot (e \cdot u)^\eta \cdot v^{1-\eta}$
- Labor market tightness:  $\theta \equiv v / (e \cdot u)$
- Job-finding proba:  $e \cdot f(\theta) = e \cdot m(1, \theta)$ .

# Labor Market with Matching Frictions

- $u$  unemployed workers:
  - ▶ Exert search effort  $e$
  - ▶  $e$  function of UI benefits  $B$
- $v$  vacancies.
- Number of matches:  $m(e \cdot u, v) = \omega_m \cdot (e \cdot u)^\eta \cdot v^{1-\eta}$
- Labor market tightness:  $\theta \equiv v / (e \cdot u)$
- Job-finding proba:  $e \cdot f(\theta) = e \cdot m(1, \theta)$ .  
 $\Rightarrow \frac{\partial e \cdot f(\theta)}{\partial \theta} > 0$

# Labor Market Equilibrium

- $\theta$  determined in equilibrium
  - ▶  $\uparrow B \Rightarrow \downarrow e$
  - ▶ Equilibrium effect on  $\theta$  depends on vacancy posting behaviour of firms
- Externalities depend on equilibrium adjustments in  $\theta$ 
  - ▶ For untreated, variations in  $B$  affects  $f(\theta)$
  - ▶  $\theta \uparrow \Rightarrow$  untreated find jobs more easily
  - ▶  $\theta \downarrow \Rightarrow$  untreated find jobs less easily

# Externalities in matching models (1)

- In models with rigid wages & diminishing returns:
  - ▶  $\uparrow B \Rightarrow \uparrow (f' - w) \Rightarrow \uparrow v \Rightarrow \uparrow \theta$
  - ▶ **Positive externality** on untreated unemployed
  - ▶ Macro effect smaller than micro effect
- Our findings
  - ▶ In line with this framework
    - Short to middle run run
    - Absence of close substitutes to labor

# Externalities in matching models (2)

- In models with flexible wages and  $\approx$  linear technology:
  - ▶  $\uparrow B_a \Rightarrow \uparrow w \Rightarrow \downarrow v \Rightarrow \downarrow \theta$
  - ▶ **Negative externality** on untreated unemployed
  - ▶ Macro effect larger than micro effect
- Our findings
  - ▶ Not fully compatible with this framework
  - ▶ Might be more adapted to think about the very long run

# Policy implications:

- Extensions less distortionary than previously thought using only  $\epsilon^m$
- Incidence of UI extensions on employers:  
↑ recruiting costs
- In the long run, wages adjust, but very little
- In the long run, reversal of sign of  $\epsilon^m - \epsilon^M$  possible if substitution and flattening of  $n^d$
- Explains difference between small reform-based and large cross-country estimates of  $\epsilon^M$

**Figure 12 : Local labor markets integration:** Fraction of new hires from non-REBP regions in total number of new hires by county
