Gillmore Centre Symposium on Central Bank Digital Currencies with Bank of England

Date: 7 May 2021: 2:00-4:00PM

Speakers:

Simon Collins, Senior Vice President of Franchise Innovation at Mastercard

Darrell Duffie, Adams Distinguished Professor of Management and Professor of Finance at Stanford University's Graduate School of Business

Central banks worldwide are in the process of developing and launching initiatives to provide their sovereign currencies in a digital form. Such central bank digital currency (CBDC) has the potential to profoundly reshape the landscape for financial and payments systems globally. Simon Collins will discuss Mastercard's learnings from managing the orchestration of multi-sided payment ecosystems and the principles that may be applied to developing CBDCs. Darrell Duffie will overview some of the motives and implications of China's Digital Currency Electronic Payment System (DC/EP).

Gillmore Centre Webinar IV:

Systemic Risk in Financial Networks: Structural sources and solutions

Bazil Sansom

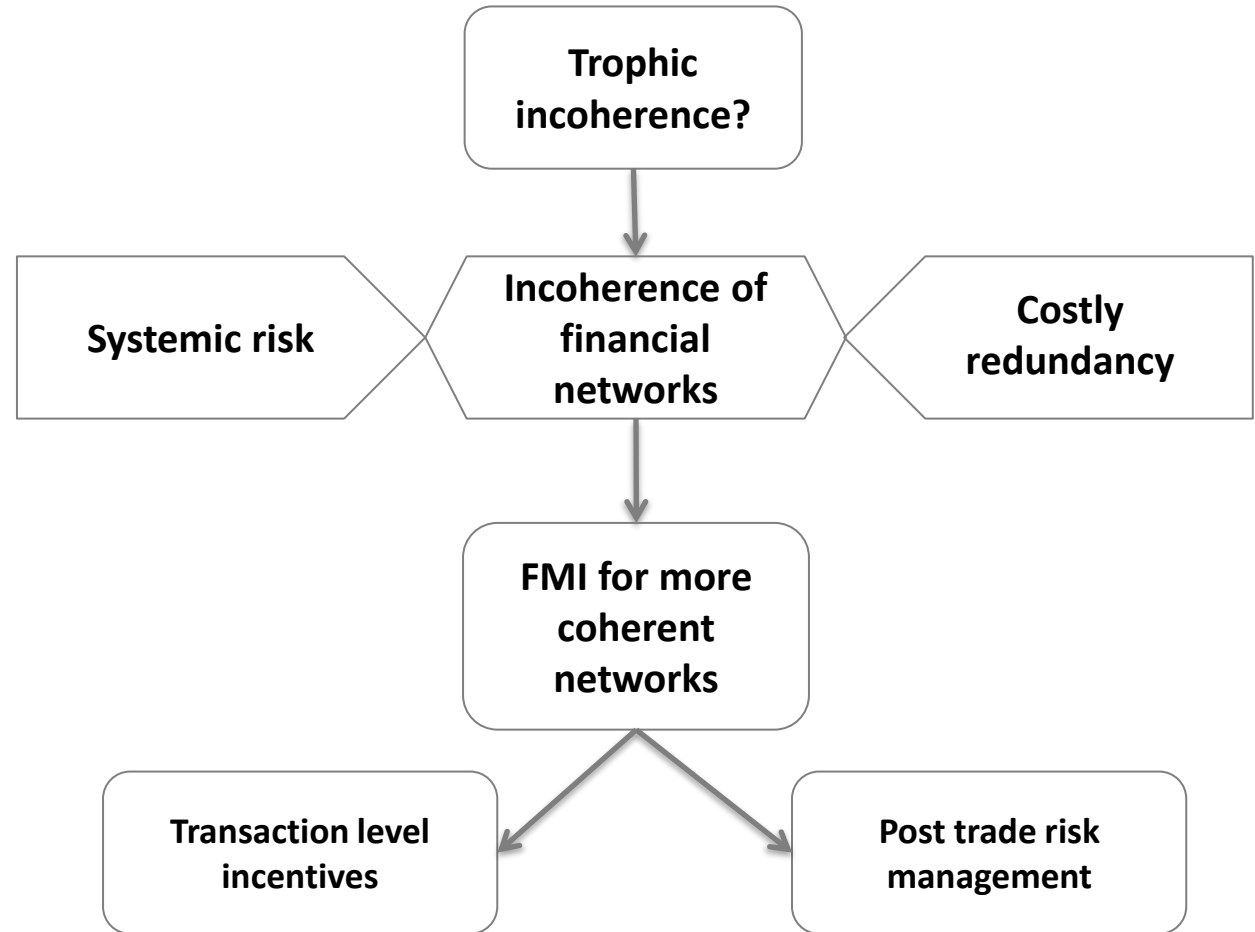

University of Warwick

The plan

New network concepts

Relevance to problems

Contribution to solutions

Trophic incoherence drives systemic risk in financial exposure networks.

- Joint work with **Robert MacKay** (Warwick) and **Sam Johnson** (Birmingham)
- Supported by the **ESRC** via the *Instability Hub* of the **Rebuilding Macroeconomics** program at the National Institute of Social and Economic Research (NISER).

What is *trophic-coherence*?

A coherent network: directional flow

change of *level* along each edge is +1.

Johnson et al. (2014); MacKay et al. (2020)

An incoherent network: circular flow

Johnson et al. (2014); MacKay et al. (2020)

***Semi-coherent networks:
directional and circulating flow***

Semi-coherent networks: directional and circulating flow

Semi-coherent networks: *directional* and *circulating* flow

How directed is a directed network?

We introduce a statistic, F_0
to quantify *trophic-incoherence*
for any directed network

Some directed networks are more directed than others!

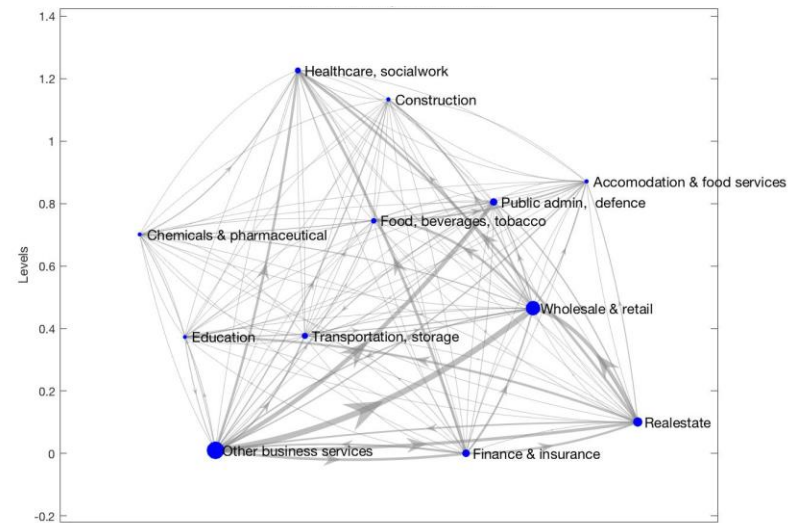

Corporate control network

Incoherence = 0.02

Very coherent

US inter-sectoral input-output network

Incoherence = 0.63

Quite incoherent

Why does *trophic-coherence* matter for systemic risk?

1

Incoherence increases
endogenous shock amplification

Cycles can destabilize large dynamical systems when they induce strong feedback loops

Trophic coherence correlates with leading eigenvalue of network

MacKay, Jonson, Sansom (2020) "How directed is a directed network?" Royal Society Open Science

Simulated shock and DebtRank

Interbank network

● banks
→ interbank loans

Balance Sheet

DebtRank: benchmark algorithm for stress propagation in lending networks.

Simulated shock and DebtRank

Interbank network

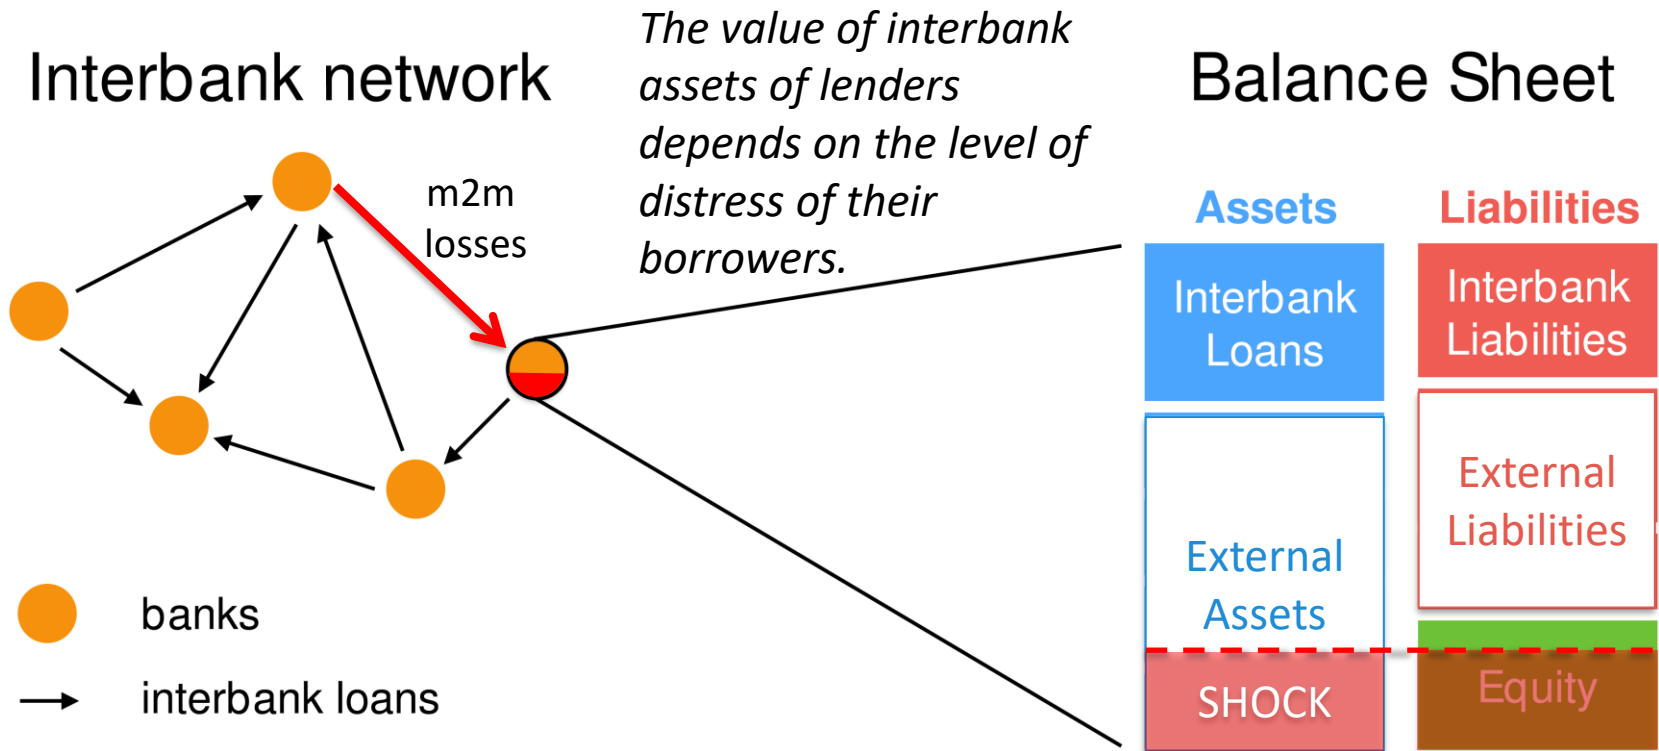

- banks
- interbank loans

Balance Sheet

Assets	Liabilities
Interbank Loans	Interbank Liabilities
External Assets	External Liabilities
SHOCK	Equity

Reduced endogenous amplification of losses in more coherent financial networks

Reduced endogenous amplification of losses in more coherent financial networks

A stress test exercise

- Vary *trophic incoherence* and *leverage* (equity/assets).

Reduced endogenous amplification of losses in more coherent financial networks

A stress test exercise

- Vary *trophic incoherence* and *leverage* (equity/assets).
- Apply uniform -1% shock to banks' external assets.

Reduced endogenous amplification of losses in more coherent financial networks

A stress test exercise

- Vary *trophic incoherence* and *leverage* (equity/assets).
- Apply uniform -1% shock to banks' external assets.
- Run DebtRank algorithm for stress propagation in interbank lending networks.

Reduced endogenous amplification of losses in more coherent financial networks

A stress test exercise

- Vary *trophic incoherence* and *leverage* (equity/assets).
- Apply uniform -1% shock to banks' external assets.
- Run DebtRank algorithm for stress propagation in interbank lending networks.
- Obtain "*Total Relative Equity Loss*" (i.e. the fraction of equity lost in the system, once dynamics converge).

Reduced endogenous amplification of losses in more coherent financial networks

A stress test exercise

- Vary *trophic incoherence* and *leverage* (equity/assets).
- Apply uniform -1% shock to banks' external assets.
- Run DebtRank algorithm for stress propagation in interbank lending networks.
- Obtain “*Total Relative Equity Loss*” (i.e. the fraction of equity lost in the system, once dynamics converge).

Results

- Apply uniform -1% shock to banks' external assets.
- Run DebtRank algorithm for stress propagation in interbank lending networks.
- Obtain “*Total Relative Equity Loss*” (i.e. the fraction of equity lost in the system, once dynamics converge).

Results

Policy implications

Systemic risk

- Buffers not necessarily enough -> need to consider interconnectedness
 - to assess fragility the system
 - to control stability

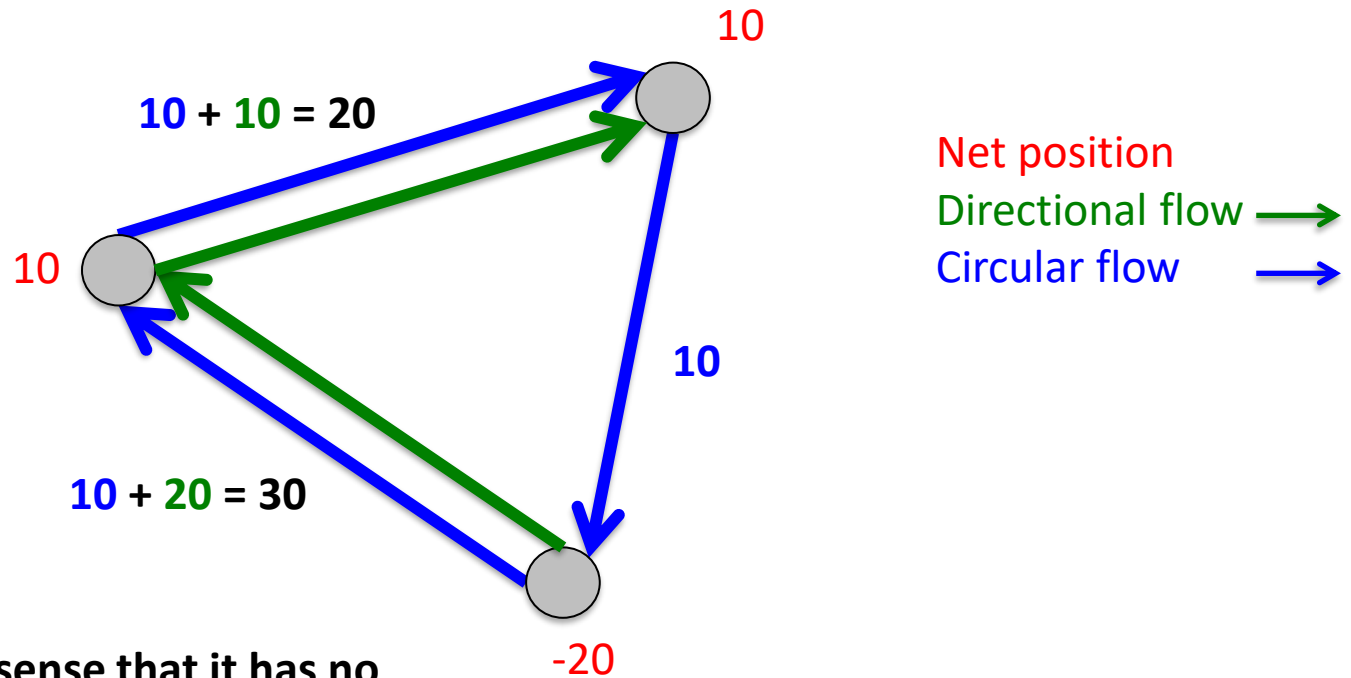

System level solutions?

- Systemic risk could be reduced by rewiring network to achieve more coherent structure.
 - Preserve connectedness
 - Remove destabilizing feedback from the system
 - ..whilst preserving *net-equivalence*

2

***Incoherence* implies redundant exposures (market excess)**

Circulating flow is redundant

- **Redundant:** in the sense that it has no impact on net positions.
- **Important:** since contributes to contagion and counterparty risk.

... so *incoherence* provides a measure of redundancy in a financial network.

Total flow = Circular flow + Directional flow

$$\text{Incoherence} = \frac{\text{Circular flow}}{\text{Total flow}}$$

Incoherence quantifies how much of total counterparty exposure balanced without contributing to net positions.

Policy implications

- Rewiring to achieve more coherent structure could achieve both:
 - More resilient topology
 - Significant portfolio compression
- The compression benefits would help reduce:
 - Total counterparty risk (thus systemic risk)
 - Required regulatory capital (where calculated on gross notional)
 - Collateral requirements (so demand for HQLA).

**Achieving more coherent
financial networks?**

Three strategies for achieving more coherent financial networks:

1. Transaction level incentives → endogenous tendency to more coherent structure
1. Post-trade optimisation → network optimisation without change of counterparties

(1) Transaction level incentives?

(1) Transaction level incentives?

(1) Ask for quotes on potential transactions with several counterparties.

(1) Transaction level incentives?

(1) Ask for quotes on potential transactions with several counterparties.

Central
counterparty

Bank

(2) Add charge proportional to trophic-level difference from 1 to quote for each transaction.

(1) Transaction level incentives?

(1) Ask for quotes on potential transactions with several counterparties.

Central
counterparty

Bank

(2) Add charge proportional to trophic-level difference from 1 to quote for each transaction.

(3) Provide list of quotes

(1) Transaction level incentives?

(1) Ask for quotes on potential transactions with several counterparties.

Central counterparty

Bank

(4) Choose transaction based on list of quotes provided

(3) Provide list of quotes

(2) Add charge proportional to trophic-level difference from 1 to quote for each transaction.

(2) Post-trade operations?

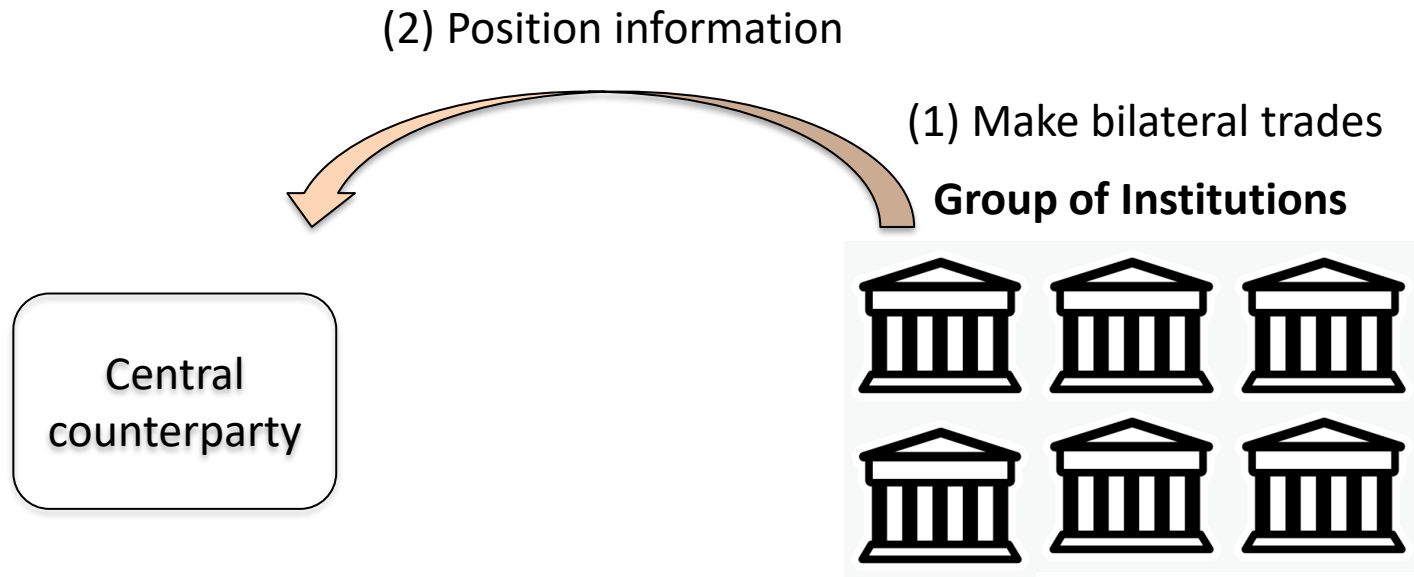

(2) Post-trade operations?

(1) Make bilateral trades

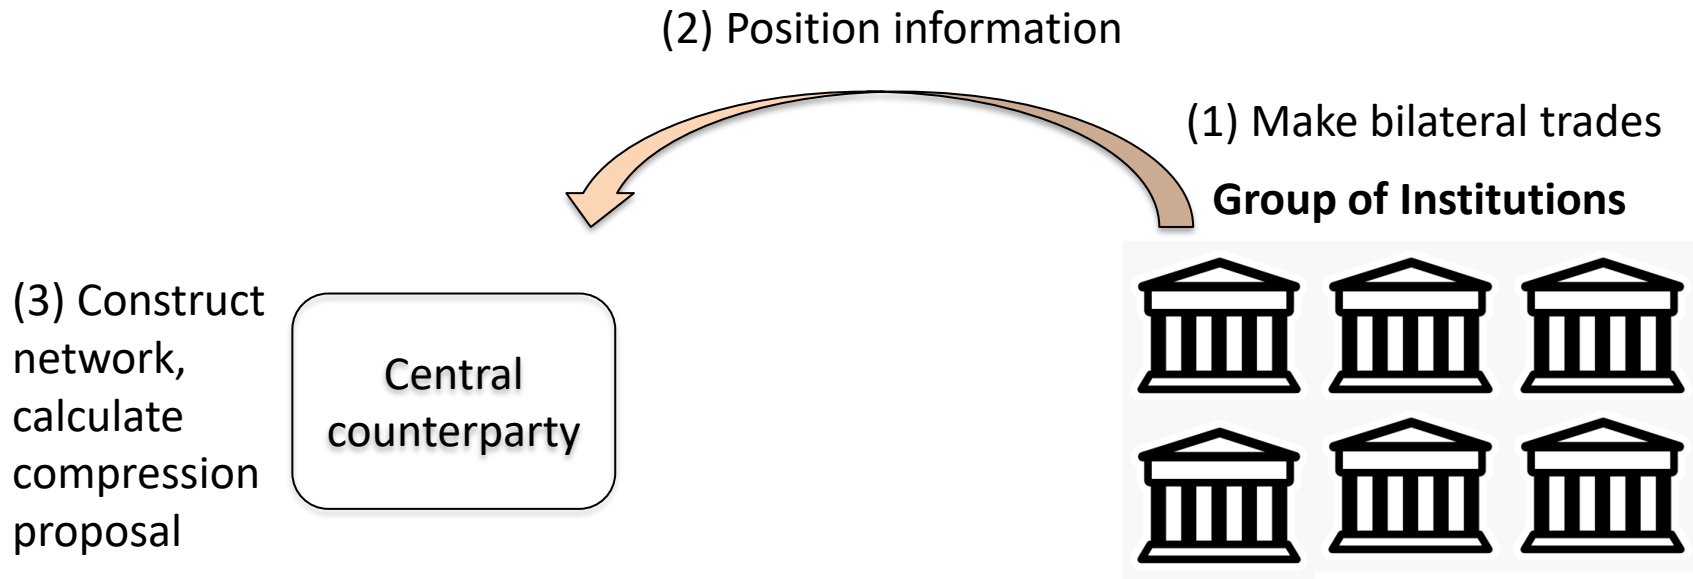

Group of Institutions

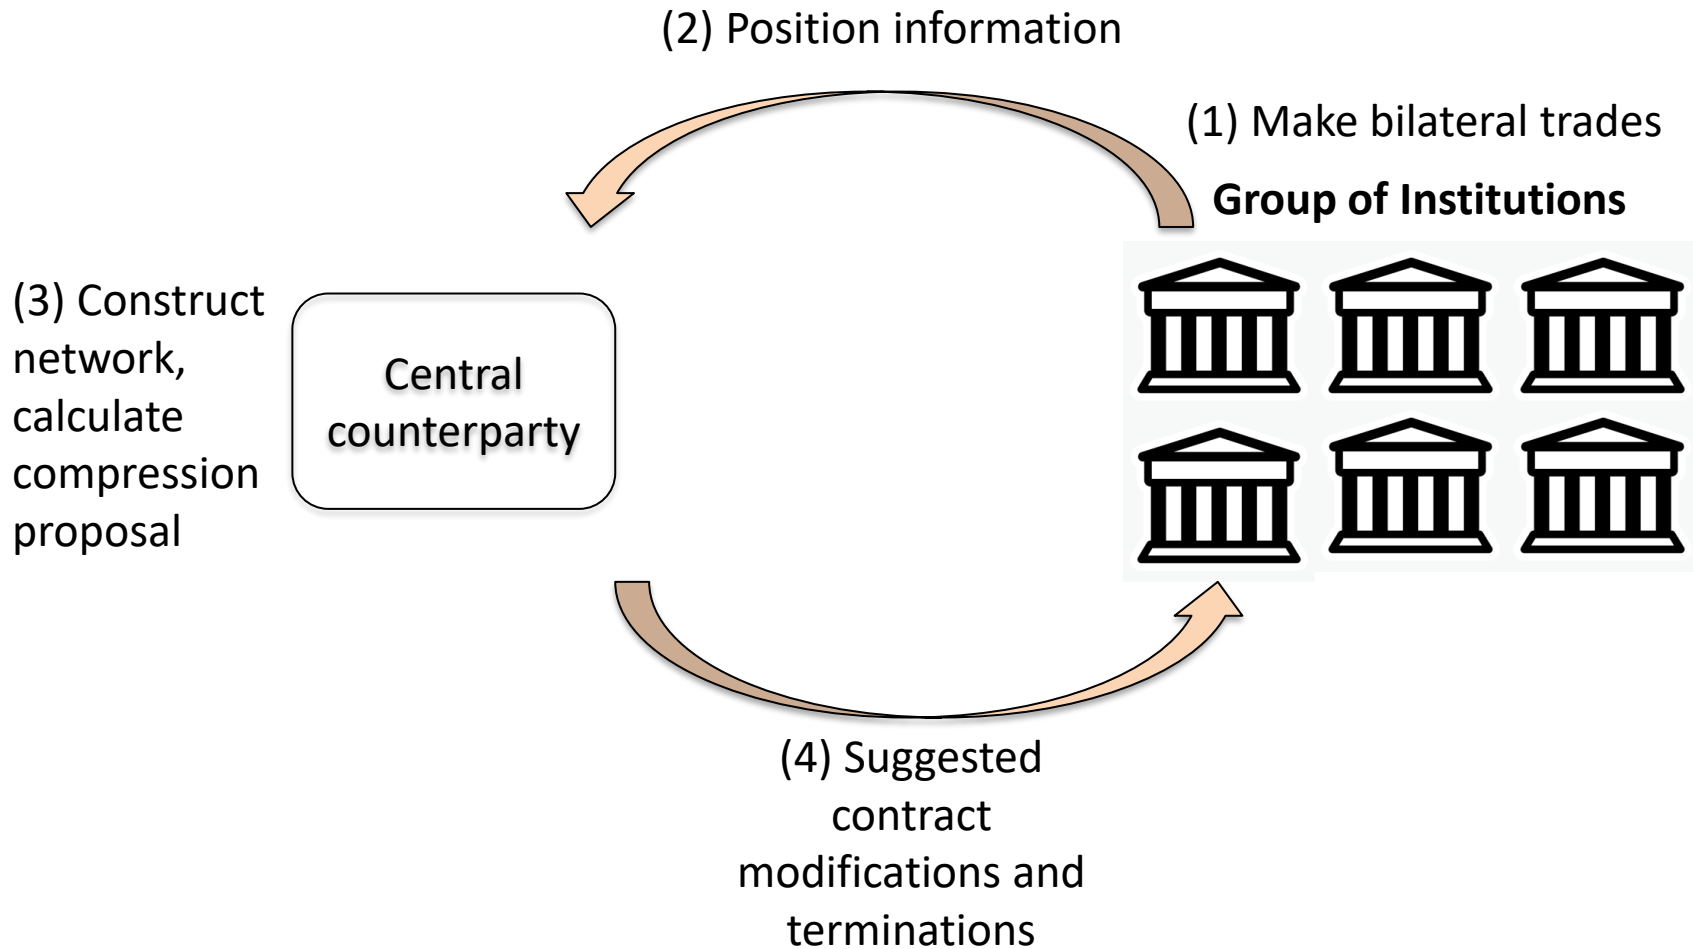

(2) Post-trade operations?

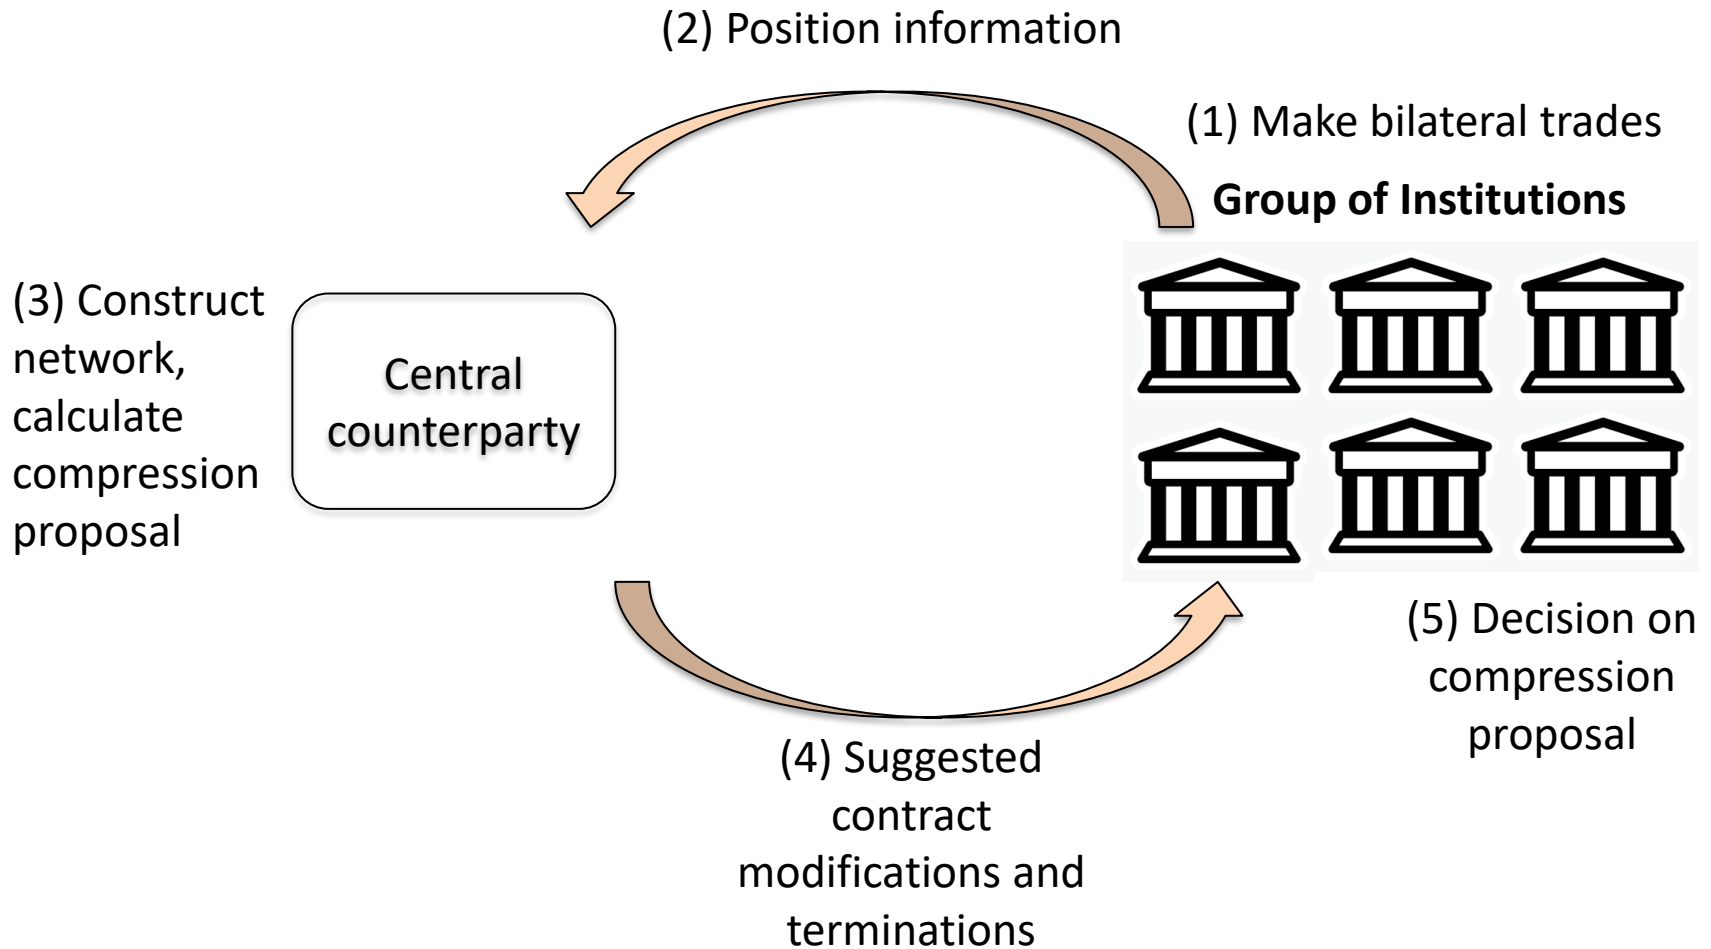

(2) Post-trade operations?

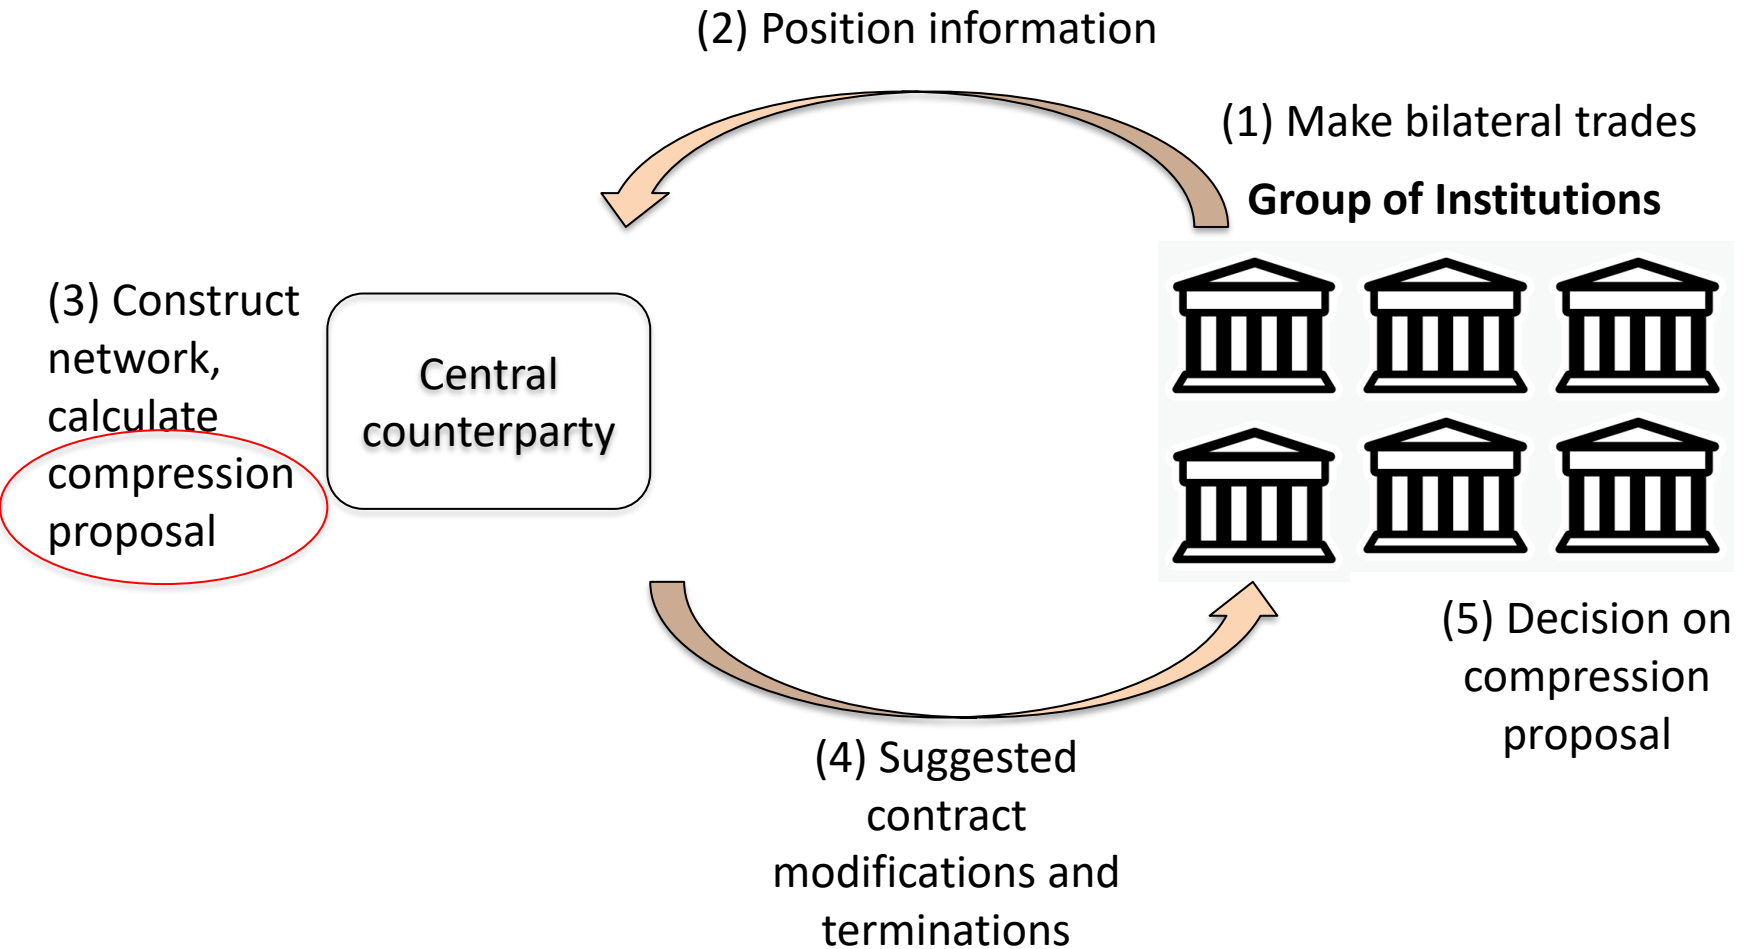

(2) Post-trade operations?

(2) Post-trade operations?

(2) Post-trade operations?

Decomposition of total flow into circular + directional components provides one solution

Total flow

-

Circular flow

=

Directional flow

Compression proposal
(Required adjustments to positions)

Optimized network

Respects:

- Net-equivalence
- Existing counterparties

Achieves:

- Significantly more coherent topology
- Significant portfolio compression

Post-trade compression services

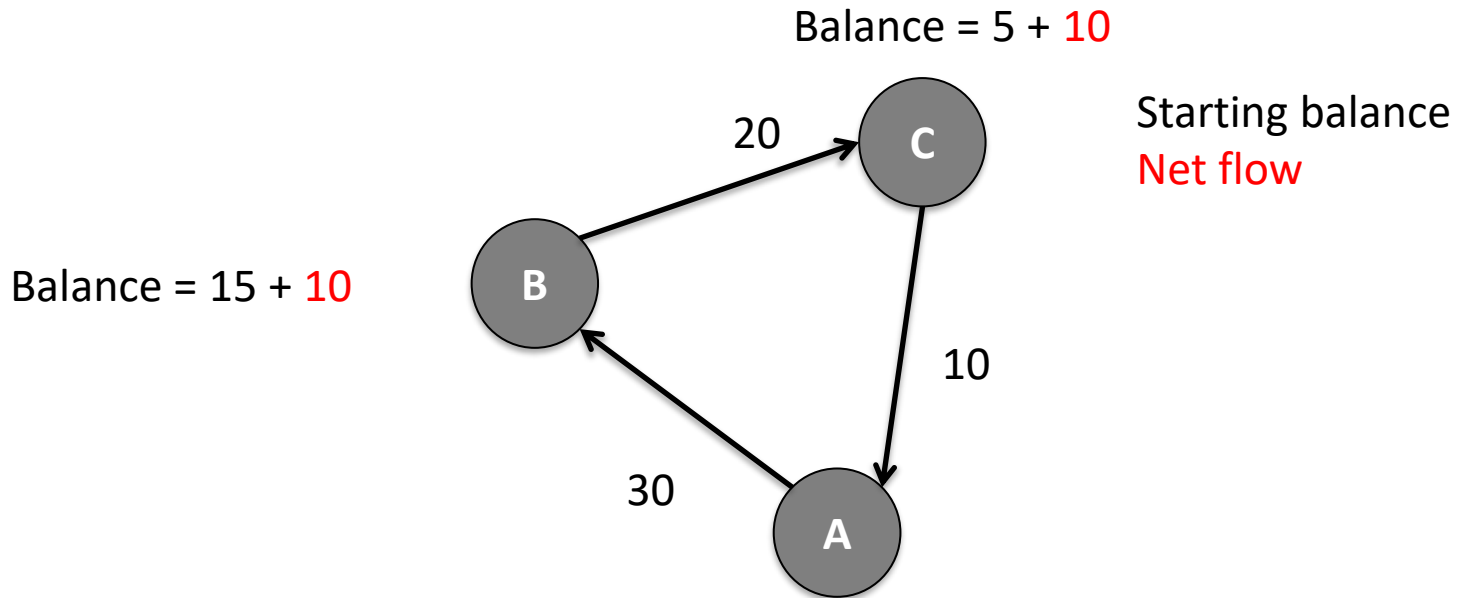

TriOptima

 CME Group

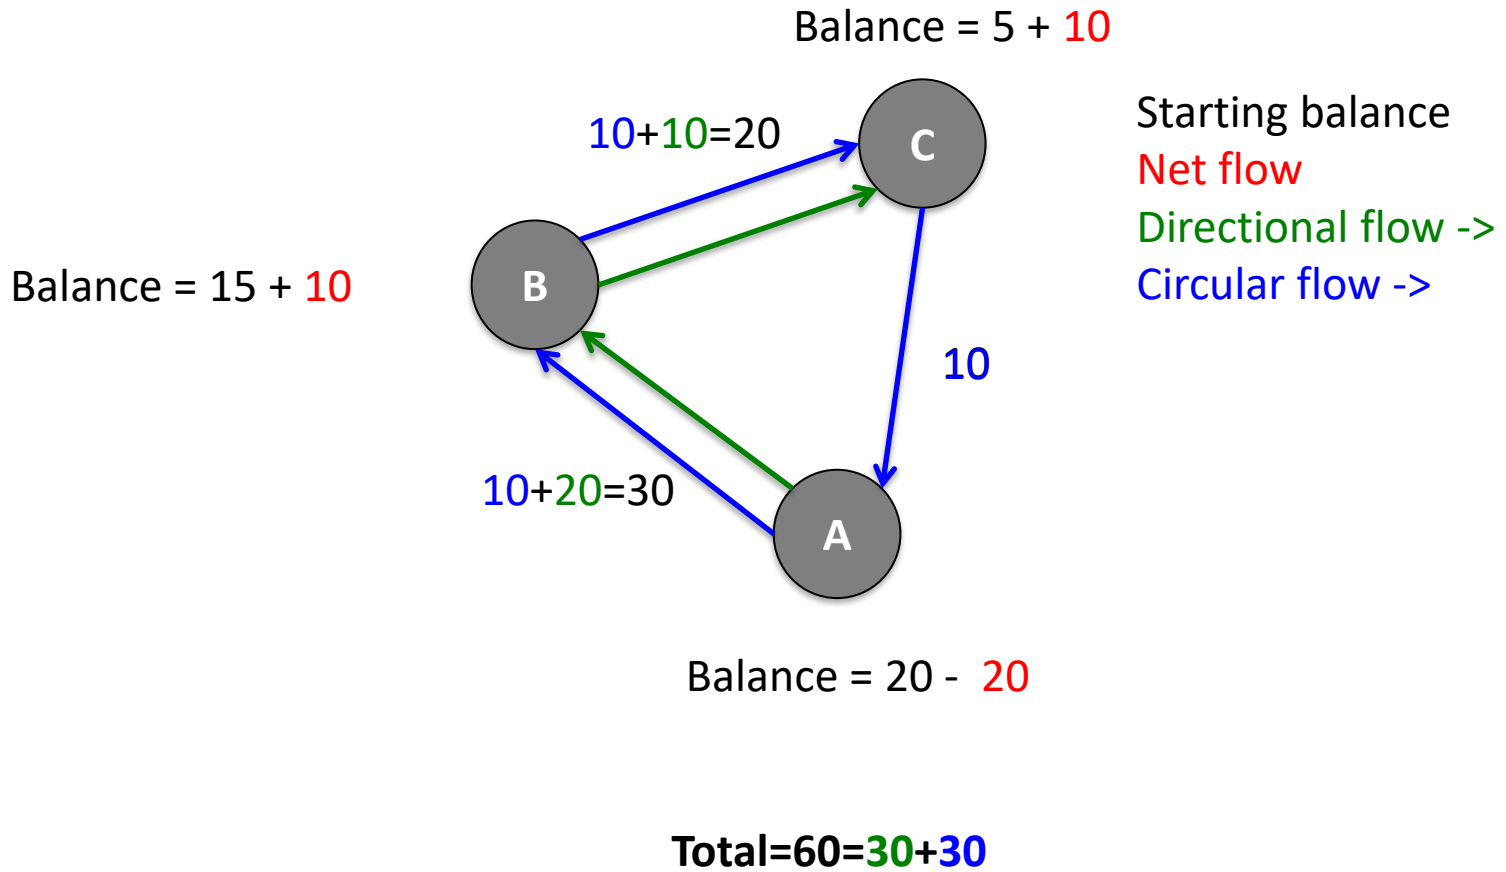

**Might also find application in analogous
payment system problem(s)...?**

Payment system 'gridlock' – toy example

Total=60

Payment system 'gridlock' – toy example

Payment system 'gridlock' – toy example

Multilateral netting resolves the 'gridlock' without need for *additional* liquidity.

Balance = 15 + 10

Starting balance

Net flow

Directional flow ->

Balance = 20 - 20

Total= 30

Complexity of real payment networks means optimal netting proposal non-trivial problem...

BoK-Wire+

Baek, Soramäki and Yoon (2014).
J. of Financial Market Infrastructure

Decomposition of total flow into circular + directional components provides one solution

(Just the solution to a linear system of equations)

Total flow = Circular flow + Directional flow

A balanced obligation network

(i.e. it can be settled all at once! Without need for liquidity).

Residual network satisfying net-equivalence.

- Requires less liquidity for settlement.
- Trophic levels provide ordering of payments! (nodes are perfectly ranked)

Summary

- Shock amplification is larger for more trophic-incoherent networks.
- Redundancies are larger in more trophic-incoherent networks.
- The tools of trophic analysis can be used to design and operate FMI able to achieve:
 - Significantly more coherent (resilient) topology
 - Significant compression/netting efficiencies

Thank you
