

Global Health within the Health GRP is represented by the Warwick Centre for Applied Health Research and Delivery (W-CAHRD) and associated collaborators from across the University. Our work consists of a broad range of observational and experimental studies looking at healthcare and public health with partners in more than 15 low- and middle-income countries.

The global health portfolio includes major projects such as the NIHR Global Health Research Unit on Improving Health in Slums, a large household and community-based survey in four countries on healthcare use and access among people who live in slums, and many smaller projects on topics such as water and sanitation, well-being and health, and infectious disease modelling.

The GRP supports the evaluation of “real-world” interventions, bringing expertise in cluster randomised trials, survey design and delivery, Geographic Information Systems, healthcare quality assessment, and applied statistics. Expertise from extensive work in the UK is translated into settings such as rural Malawi, slums in Lagos, and refugee camps in Bangladesh to provide state-of-the-art methods in resource-poor settings. Our collaborators represent many sectors including local and national governments, international NGOs, UN agencies, and academic institutions.
