

**RESEARCH
TECHNOLOGY
PLATFORMS**

WARWICK
THE UNIVERSITY OF WARWICK

WHAT ARE THE RESEARCH TECHNOLOGY PLATFORMS?

The University of Warwick's Research Technology Platforms (RTPs) provide an integrated network of world-class facilities and expertise that enable researchers to perform outstanding science.

We aim to enhance local, regional and international research outcomes by providing researchers with access to a network of cutting-edge technology platforms, operated with world-best expertise and leadership principles, to enable innovative research of the very highest quality.

A key feature of the RTP programme is that access is open to researchers across all disciplines within the University, as well as external partners from academia and industry. Equally, the RTP programme acts as an access point for industry to make use of a wider range of experimental techniques and the ability to talk directly to the technical experts who can provide bespoke analysis.

Each RTP has a dedicated support team who are devoted to the smooth running of their facility, with maximum available usage time, and to helping researchers optimise the benefits from using the RTP. As experts in their techniques, they can provide

specialised training and advice on data analysis; often they will be pioneering new methodologies from which users subsequently benefit.

The RTP programme, overseen by myself as the Deputy Pro-Vice-Chancellor (Research), enables Warwick to take a coordinated approach to its key research technologies and ensure they remain at the state-of-the-art. By listening to the needs of our multi-disciplinary user base, we determine the strategic future direction of each RTP and identify new areas that can be supported in this expanding programme.

I hope that this brochure provides you with some ideas of the range of opportunities available within the RTPs and that we will soon be able to help with your research and/or address your technical challenges.

Professor David Leadley
Deputy Pro-Vice Chancellor (Research)

 40 Academic and Technical Staff	 Use from 200+ research groups	 700+ external contracts	 £14m Investment in capital
--	--	------------------------------------	---------------------------------------

OUR STAFF

This brochure highlights the cutting-edge technologies that the RTPs provide access to. However, without our knowledgeable technical professionals the RTPs simply could not operate. We are extremely fortunate to have dedicated and approachable experts in their fields to underpin both the research at Warwick as well as helping solve challenges brought to us by industry and other institutions. Our staff add great value to the investment that we have made and deserve recognition for the work they do.

If you are publishing work that has benefitted from the support our staff have provided, please do check out our fair attribution policy and help us ensure the correct level of visibility and recognition for the contribution they have made: warwick.ac.uk/research/technicians/fairattribution

ADVANCED BIOIMAGING

Dr Corinne Smith, Advanced Bioimaging RTP Director
corinne.smith@warwick.ac.uk | 024 7652 2461

Dr Saskia Bakker, Advanced Bioimaging RTP Manager
s.bakker@warwick.ac.uk | 024 7657 4095

The Advanced Bioimaging RTP was established in 2015. It supports the investigation of complex biological problems by researchers at Warwick and externally, through the application of cutting-edge imaging technologies. The RTP specialises in advanced light and electron microscopy.

The RTP houses two electron microscopes. The JEOL2200FS (2016) is equipped with a field emission gun electron source, an in-column energy filter, and a Gatan K2 Direct electron detector. The JEOL2100Plus (2018) is fitted with a LaB6 filament and a Gatan OneView IS CMOS camera. Additionally, the suite boasts a Leica GP plunge-freezer, an RMS cryo-ultramicrotome, and other supporting equipment such as a glow discharger and a carbon coater.

External users can be trained to use the equipment or imaging can be carried out as a service.

AT A GLANCE

Imaging temperature down to **-176°C**

£2m worth externally funded equipment

70nm slice thickness

CAPABILITIES

Thin section TEM

Room-temperature TEM of thin sections of embedded cells or tissues can give information about cell morphology and changes in cellular ultrastructure. By using immunogold labelling techniques, certain protein locations can be identified. Tomography can give a 3D view of smaller cellular structures.

Negative stain TEM

Negative stain TEM is a quick and cheap way of looking at purified samples such as nanoparticles, proteins and viruses. The sample is surrounded by a heavy-metal containing stain and dried, which provides contrast in the electron beam. Negative stain TEM is a good method to answer questions about particle morphology, sample homogeneity and particle size.

Cryo-TEM

Cryo-TEM provides information on the interior structure of samples including nanoparticles, soft materials including polymers, purified protein, protein complexes and viruses. The sample is flash-frozen and imaged at liquid nitrogen temperatures. This provides a more native-like environment for biological samples and allows for imaging of polymer samples that are unsuitable for dry-state TEM. By collecting a large amount of data and processing the images, 3D structures can be obtained for suitable purified proteins. Low-resolution 3D structures can also be obtained by cryo-tomography.

DiSPIM

The dual inverted light-sheet microscope (DiSPIM) allows for fluorescent imaging of relatively large and living specimens with low phototoxicity. Because the sample is imaged from two orthogonal angles, the data has good resolution in three dimensions.

"It's a really professional setup. We've never had any issues and we've always been able to access the kit when we need it. Everything happens smoothly and it's a really easy relationship."

BIOINFORMATICS

www.warwick.ac.uk/bioinformatics

Dr Sascha Ott, Bioinformatics RTP Director
S.Ott@warwick.ac.uk | +44 (0)24 7615 0258

Richard Stark, Bioinformatics RTP Manager
R.Stark@warwick.ac.uk | +44 (0)24 7657 4266

Over the past few decades there has been a rapid increase in the size and complexity of biomedical data produced as a result of advances in technologies underpinning DNA sequencing, proteomics, metabolomics, and imaging. This is allowing researchers ever deeper insights, but also brings an ever increasing demand for the expertise to handle such large scale data sets. The Bioinformatics RTP provides the necessary expertise, with a focus on delivering the best quality analysis and aiding accurate interpretation of data from high-throughput biomedical experiments.

CAPABILITIES

Our services include:

- ▶ Planning of experimental and computational workflows to enhance data processing and interpretation.
- ▶ Collaboration on complex bioinformatics analysis challenges.
- ▶ Adaptable computing cluster technologies to meet your needs.
- ▶ Strengthening of grant applications with a range of bioinformatics input.
- ▶ Support generating figures and submitting data to repositories.
- ▶ Bioinformatics training and clinics for one-to-one advice.
- ▶ Provision of bioinformatics tools on the web or as mobile phone apps.

Computing hardware

The Bioinformatics RTP has access to several HPC cluster systems. Some we manage ourselves, and some are managed for us by the Scientific Computing RTP. These provide computational power far beyond that available on a desktop machine in terms of both CPU core count and available RAM. You can apply for accounts on these machines, or RTP staff are able to run analyses on your behalf.

List of Instruments /techniques

Our team provides assistance in bioinformatics across a broad range of data types and platforms and at all stages of the experimental procedure; from experimental design, through analysis and interpretation, to delivering results as figures and as interactive web tools.

Techniques on which we regularly work with researchers include (meta)genomics, transcriptomics and proteomics, single-cell sequencing technologies, sequence assembly and regulatory sequence analysis. This is not a comprehensive list of the ever-evolving techniques with which our team has expertise and our experience can prove useful in other fields, so please contact us to discuss how we can help with your research.

“The Bioinformatics RTP have been invaluable in the installation and setup up of a new database systems which will help us manage and distribute our seed resources. Their expertise and flexible, professional approach has been key to enabling the timely installation, and I very much look forward to working with them on other projects.”

DR CHARLOTTE ALLENDER,
WARWICK GENETIC RESOURCES UNIT

ELECTRON MICROSCOPY

Professor Richard Beanland, Electron Microscopy RTP Director
r.beanland@warwick.ac.uk | 024 7657 3884

Steve York, Electron Microscopy RTP Manager
s.york@warwick.ac.uk | 024 7652 3391

The Electron Microscopy RTP is a central facility for the University of Warwick and is one of the leading centres in the UK. It contains a wide range of microscopes in a purpose-built suite, including: high resolution scanning electron microscopes (SEM); focused ion beam (FIB); several transmission electron microscopes, from simple imaging to atomic resolution; and state of the art scanning probe microscopes (SPM/AFM). There are currently more than 200 registered users of the microscopes, both within the University as well as external commercial and academic users.

Work can be performed by highly experienced RTP staff. We also provide training and offer self-use of equipment.

CAPABILITIES

List of Instruments /techniques

Scanning electron microscopy (SEM); energy-dispersive X-ray (EDX) analysis; cathodoluminescence (CL); cryo-SEM; focused ion beam (FIB) microscopy; transmission electron microscopy (TEM); electron energy loss spectroscopy (EELS); scanning probe microscopy (SPM); atomic force microscopy (AFM); optical microscopy; specimen preparation.

3 TEM: The Jeol 2100 TEM can be used in scanning mode. Bright field and annular dark field images can be collected simultaneously and has an energy-dispersive X-ray detector to provide information on the chemical composition of a sample.

The Jeol ARM200F is a high-resolution aberration-corrected transmission electron microscope. This allows atomic resolution imaging both in STEM and TEM modes. The microscope has an electron energy loss spectrometer to allow detection and quantification of the elemental composition down to the atomic level. The microscope also has a energy-dispersive X-ray detector. This also yields composition maps with atomic resolution; both EDX and EELS spectra can be collected simultaneously.

SEM: Two scanning electron microscopes are able to image surfaces and handle a wide variety of samples, from conducting and non-conducting materials, beam sensitive or non-conducting samples. It has a resolution of 1-4nm and secondary electron, backscattered and in-lens imaging modes. There is an energy-dispersive X-ray (EDX) spectrometer that allows elemental composition analysis and a cryo transfer system and stage is available to allow low temperature imaging of materials that are unstable in vacuum at room temperature such as liquids and gels. A STEM detector and multi-TEM-sample holder is also available.

FIBSEM : The FIBSEM has two columns; a column used in taking scanning electron microscopy

images (SEM), and a ion column to allow focused ion beam (FIB) cutting. The FIB allows for very precise cutting of samples, with the SEM able to image the process in real time. A micromanipulator is also available to allow the user to pick up small objects. This opens up many possibilities, including picking up individual particles a few micrometers in size, making a TEM specimen from a specific site with nm precision.

ATOMIC FORCE MICROSCOPY: The atomic force microscope is suitable for use with a wide range of samples and features a vast array of modes. The AFM is able to image conductive, semiconducting and insulating samples in both air and liquid environments. The head can be adjusted to fit a wide range of sample sizes. A heating stage (30 to 250 Celsius) is also available with the ability to image under a constant flow of N2.

SPECIMEN PREP: Cutting; Polishing; Ion beaming for TEM samples.

“The technical staff in the Electron Microscopy RTP have been excellent at carrying out the measurements we need and using their experience to input on experimental design. They help fulfil the potential of the state-of-the-art equipment they provide access to.”

BYK ADDITIVES

POLYMER CHARACTERISATION

Professor David Haddleton, Polymer Characterisation RTP Director
d.m.haddleton@warwick.ac.uk | 024 7652 3256

Dr. Daniel Lester, Polymer Characterisation RTP Manager
d.lester@warwick.ac.uk | 024 7657 4147

The University of Warwick is a globally-recognised centre of excellence in polymer research, which is underpinned by the state-of-the-art Polymer Characterisation RTP. The RTP houses a world class size exclusion chromatography (SEC) suite, a wide range of thermal analysis equipment, particle sizing from nanometre to micrometre scales, materials analysis, such as rheology and mechanical testing, and contact angle measurement. On top of this we have access to more general analytical techniques such as, GC, IR and HPLC.

In addition to experiments using the analytical techniques above, external users can take advantage of formulation development and analysis, plus bespoke project design to meet your requirements.

>25
instruments

50+
external
clients

1250
hours of instrument
use each month

CAPABILITIES

Gel Permeation Chromatography (GPC) / Size Exclusion Chromatography (SEC)

GPC/SEC separate on the basis of size, allowing for the accurate measurement of molecular weight averages and distributions. With advanced detectors (LS/VS), properties such as molecular size (R_g and R_h) and true molecular weight can also be measured. The Polymer Characterisation RTP is one of the few facilities world-wide that can offer SEC/GPC for a range of organic solvents (DMF, THF and CHCl_3 - but expandable to solvents such as DMAc), in addition to specialist aqueous and high temperature measurements. This includes a new BioSEC instrument for size separating and analysing biomaterials (such as proteins).

Thermal Analysis

The Polymer Characterisation RTP has three techniques for thermal analysis: thermogravimetric analysis (TGA), differential scanning calorimetry (DSC) and dynamic mechanical analysis (DMA).

The two TGAs (including a TGA/MS) can be used to determine the thermodynamics and kinetics of processes involving weight loss, such as corrosion or oxidation. The two DSCs provide quantitative measurement of phase transitions used to determine composition and properties of materials. The two DMAs allows the study of the viscoelastic behaviour of polymers from temperature/frequency sweeps or dynamic stress-strain testing. DMA also allows analysis of polymers analogous to DSC but with greater sensitivity.

Materials Testing

The Polymer RTP has a universal testing rig for characterising the mechanical properties of materials. This is tailored towards polymer materials, having a relative small load cell (500N). Typical measurements are tension, compression and peel, allowing determination of properties such as upper tensile strength, Young's modulus and elasticity.

The facility also has a rheometer with parallel plates in various diameters, which compliments the DMA and mechanical testing, allowing determination of properties such as elasticity and viscosity.

Particle Size Determination

The particle size determination equipment in the Polymer Characterisation RTP is able to

size materials from 0.6 nm to 500 μm via dynamic light scattering (DLS) or laser diffraction (LD). This provides an adaptable platform for a wide range of samples in a multitude of dispersants. We have 3 instruments available for this including two brand new.

Drop Shape Analyser

The RTP has a drop shape analyser (DSA) that allows for the measurement of static and dynamic contact angles of liquids on surfaces, interfacial and surface tension of liquids and surface energies of solids.

Infra-Red Spectroscopy

IR (sometimes FTIR) is a ubiquitous but under used technique that can give insight into chemical composition by analysis of bending and stretching modes of certain functional groups. This technique is suitable for solid state and can be applied to almost any analytical challenge.

GCFID/GCMS

The facility has two GC instruments with different detectors, allowing the gas phase separation and analysis of high-volatility analytes. These can be used for concentration determination of analytes via FID (flame ionisation detection) or chemical identification via MS (mass spectrometry).

HPLC

The facility has an HPLC with PDA detector and access to four more for liquid phase separation and analysis.

"WSS / The Polymer RTP have provided us with an outstanding service, delivering leading edge science to help advance our research."

DR DAVID BELL, UNILEVER

PROTEOMICS

Dr Alex Jones, Proteomics Facility RTP Director
alex.jones@warwick.ac.uk | 024 7652 8144

Dr Andrew R. Bottrill, Proteomics Facility RTP Manager
proteomics@warwick.ac.uk | 024 7657 4182

The Proteomics RTP provides service and support to academic and commercial researchers seeking to identify and quantify proteins and their modifications. The analysis of protein mixtures from gel slices, co-immunoprecipitations or enrichments is routine and we can identify several thousand proteins in complex samples such as, cell lysates and tissue extracts. Our favourite challenges include the analysis of protein phosphorylation and post-translational modification mapping. You will find support from an enthusiastic proteomics team to help with scientific discussion, experimental design, sample preparation, analysis of data and provision of training.

Bespoke
experimental
design

126

users from 65
research groups

CAPABILITIES

Experimental design and sample preparation

Sample quality is critical to obtain outstanding mass spectrometry results. Using the right protocol for your sample will maximise the quality of your results.

We can help with cell/sample labelling (SILAC or TMT) and selecting the most appropriate experiment and protocol to investigate the full proteome, cell fraction proteomes, protein immune precipitations, peptide enrichment and PTM experiments. And, we are open to new ideas!

Protein digestion is adapted for optimal recovery and deep proteome analysis. We have a broad range of sample preparation protocols including in gel, in solution and FASP protein digestion. Additionally, we can clean up and concentrate peptides (StageTip) or enrich phosphorylated peptides using specific resins.

List of Instruments /techniques

Orbitrap Fusion with UltiMate 3000 RSLCnano System (Thermo Scientific)

► Identify and Quantify unknowns from complex mixtures.

Chromatography and mass spectrometry analysis are adapted to your sample for protein/peptide identification and quantification. Reverse phase C18 nano-chromatography is available using a range of gradients (30 to 240 min) and columns (15 to 50 cm long). The Orbitrap Fusion has the power and versatility to analyse with high resolution (Max. 500,000 Hz) in the Orbitrap or high speed and sensitivity using the linear trap (LTQ). It can identify and quantify 2,000 proteins per hour in a standard experiment.

Quantiva triple quadrupole with UltiMate 3000 RSLCnano System (Thermo Scientific)

► Validate targets generated from analysis of complex mixtures

Targeted quantification of known compounds (peptides or metabolites) with high accuracy and sensitivity using selected reaction monitoring (SRM). A range of chromatographic options are available including nano-LC (as Orbitrap above) and high flow rate analytical UPLC for ultrafast identification with high accuracy and sensitivity.

Data analysis

The Proteomics RTP utilises powerful workstations to interrogate databases for protein identification and quantitation. A range of search tools are provided including MaxQuant, Mascot and Sequest. Label free, SILAC and TMT quantification is possible at protein/peptide and post-translational modification site level.

Data return to users is provided via Scaffold software for basic needs and via Perseus where detailed statistical analysis is required. Skyline is utilised for targeted experiments.

We do basic comparative quantitation analysis and more detailed data analysis as Principal component analysis (PCA), sample correlation test, heat map hierarchical clustering, gene ontology category enrichment analysis and kinase motif analysis.

SCIENTIFIC COMPUTING

Professor David Quigley, Scientific Computing RTP
Director D.Quigley@warwick.ac.uk | 024 7657 4100

Dr Matt Ismail, Scientific Computing RTP Manager
Matthew.Ismail@warwick.ac.uk | 024 7657 4267

Dr Chris Brady, Research Software Engineer
rse@warwick.ac.uk

The RTP provides a Linux-based shared infrastructure for research computing. We manage a Linux research computing environment deployed to hundreds of PCs and workstations and also accessible via remote desktop. The RTP hosts Warwick's High Performance Computing (HPC) clusters for batch processing of computationally intensive workflows, such as large-scale simulations, high throughput parameter searches and analysis of large datasets. Our Research Software Engineering (RSE) team provide training and consultancy as well as more direct support via secondment to research projects.

 **200**

research groups

CAPABILITIES

List of facilities/services

- ▶ Managed Linux research computing environment coupled to high capacity user and group network storage.
- ▶ HPC clusters for large-scale parallel computing and batch processing of high throughput workloads.
- ▶ Research Software Engineering (RSE) team providing training and consultancy to users of the RTP facilities, and longer-term software engineering support via secondment to research projects.

Please contact us to check compatibility **before** purchasing hardware or software to use with our systems.

Managed Linux desktop computing environment

Users registered with the RTP have access to our systems via remote desktop, or by deploying our managed Linux configuration onto local desktop hardware. Each user has access to networked data storage, software development tools including the GNU, Intel and Portland Group compiler suites, numerical libraries and a managed scientific software stack. Commercial scientific packages (Matlab, Maple, Mathematica) licensed centrally by the university are also available. We deliver a large (currently 1 Petabyte) group storage system to these desktops, suitable for large datasets shared by multiple users.

Tinis

HPC cluster with 203 compute nodes, each with 2 x Intel Xeon E5-2630 v3 (Haswell) 2.4 GHz 8-core processors and 64 GB DDR4 memory per node. The nodes are linked by QLogic TrueScale Infiniband allowing all 3488 compute cores to operate as a single parallel computer.

Tinis also contains 4 nodes each equipped with 2 x NVIDIA Tesla K80 Graphics Processing Units (GPUs), 4 nodes equipped with 2 x Intel Xeon Phi 7120P "Knights Corner" processors (61 cores per processor) and 4 high memory nodes each with 1TB RAM and an NVIDIA GRID K2 GPU for in-memory data analytics.

Orac

84 compute nodes each with 2 x Intel Xeon E5-2680 v4 (Broadwell) 2.4 GHz 14-core processors and 128 GB DDR4 memory per node. These nodes are linked with Intel Omni-Path X16 100 Gbit/s fibre.

Orac also contains 4 nodes equipped with a Xeon Phi 7250F (Knights Landing) 1.4 GHz 68-core host processor and 96 GB DDR 4 memory per node. An additional node contains 2 x IBM POWER8 3.259 GHz 8-core processors with 256 GB DDR4 memory and 4 x NVIDIA P100 GPUs. This serves as a testbed for machine-learning applications.

"The RSEs are an extremely useful knowledge resource, teaching new PhD starters to optimising previously written code for our research."

SPECTROSCOPY

Professor Mark Newton, Spectroscopy RTP Director
M.E.Newton@warwick.ac.uk | 024 7655 0799

Dr Ben Breeze, Spectroscopy RTP Manager
B.Breeze.1@warwick.ac.uk | 024 7657 2865

General enquiries spectroscopy@warwick.ac.uk

The Spectroscopy RTP has enabled easier access to the facilities and tailored training for spectroscopic data that supports Warwick's world class scientific research. The range of complementary techniques available at the RTP enables non-destructive investigation and characterisation of liquid, solid and gaseous samples.

Services include, Raman, photoluminescence and optical absorption spectroscopy and microscopy; fluorescence microscopy and electron paramagnetic resonance. In addition to these techniques we are able to create custom experiments to meet specific non-standard needs. The RTP has access to specialised data analysis software and databases of reference spectra to aid material characterisation.

"The spectroscopy RTP facility at Warwick University provides excellent training and access to high specification Renishaw Raman spectrometers. The RTP facility provides exceptional support for characterisation of materials enabling world leading research."

JAI GUPTA,
WMG

CAPABILITIES

Raman Spectroscopy and Microscopy

Raman spectroscopy measures inelastically scattered light from a sample. Laser light focused onto a sample interacts with molecular vibrations or phonons with the lattice and is scattered with a lower energy (Stokes) or higher energy (anti-Stokes). The Raman spectrum gives insight into the structural properties of a material and each material provides a unique fingerprint.

Combining Raman spectroscopy with a microscope allows a precise point on a surface to be analysed and maps of samples to be built up. The RTP equipment is able to perform Raman measurements and maps using different excitation wavelengths ranging from UV to NIR and has stages capable of making measurements at temperatures from 4 K to 1450 K.

Photoluminescence Spectroscopy and Microscopy

Photoluminescence (PL) spectroscopy provides information on the electronic structure of a material, such as the band gap or defects present in semiconductors. This non-destructive technique focuses laser light onto a sample, exciting electrons

which absorb this light into a higher-energy state; these electrons relax to ground states emitting light that is collected.

FT-IR Absorption Spectroscopy and Microscopy

FT-IR Absorbance spectroscopy can be used for both qualitative and in some cases quantitative investigations. Samples can be characterised in bulk or spatial maps can be built up using a Microscope. The Infrared absorption spectrum is produced from the light interacting with chemical bonds at vibrational and rotational frequencies allowing identification materials and defects.

UV Vis Optical Absorption Spectroscopy

The absorption equipment available at the RTP allows investigation of the optical properties of materials using monochromatic light of wavelengths in the UV and visible regions. UV-VIS Absorbance spectroscopy gives an indication of electronic structure but is most often used to determine concentrations of samples using the Beer-Lambert Law.

Electron Paramagnetic Resonance

EPR is used for study and quantification of chemical species that have one or more unpaired electrons such as organic and inorganic free radicals or inorganic complexes possessing a transition metal ion. EPR spectroscopy is used in various branches of science, such as chemistry and physics, for the detection and identification of free-radicals and paramagnetic centres. EPR is a sensitive, specific method for studying both radicals formed in chemical reactions and the reactions themselves.

X-RAY DIFFRACTION

Professor Richard Walton, XRD RTP Director
r.i.walton@warwick.ac.uk | 024 7652 3241

Dr David Walker, XRD RTP Manager
d.walker.2@warwick.ac.uk | 024 7615 1299

Dr Steven Huband, SAXS Specialist
s.huband@warwick.ac.uk | 024 7615 1782

warwick.ac.uk/x-ray

The X-ray Diffraction (XRD) RTP has a wide range of x-ray technologies and expertise in data analysis. A dedicated team of three members of staff can help train you, provide access to state-of-the-art equipment or carry out experiments on your behalf. The RTP houses 5 powder diffractometers, 2 single-crystal diffractometers, 2 high-resolution diffractometers, a wavelength dispersive x-ray fluorescence (WD-XRF) spectrometer and a small angle x-ray scattering (SAXS) system.

Measurements from
-261°C to 1200°C

CAPABILITIES

The XRD RTP has a range of x-ray centric techniques. Typical measurements include phase identification, structural determination, Rietveld refinement; determination of phase contamination and sample purity; layer thickness, composition and roughness; stress and texture measurements. Advanced functional materials such as power electronics, coatings, solar cells, catalysts steels and energy storage materials are a particular focus, but we also have growing experience in the study of soft matter such as polymers and organic materials.

X-ray Diffraction

XRD is a powerful non-destructive technique for characterizing crystalline materials. At Warwick we have powder, single-crystal and high-resolution diffraction capabilities.

Powder XRD relies on diffraction from randomly orientated grains to produce a semi-unique 1D pattern, which can be matched against a database of known structures or to refine a structural model (Rietveld refinement) for atomic level crystal structure information. Warwick has 5 diffractometers covering high-throughput, high-resolution, high-temperature (up to 1200 °C), low-temperature (down to 12 K) and in-situ reactions.

Single-crystal diffraction is a powerful X-ray technique for the solution of crystal structures, providing key information on symmetry and atomic positions. Usage spans from routine structural work on organic and metal-organic small molecules to highly detailed investigations of heavy metal oxides. Warwick is equipped with two powerful single-crystal diffractometers, including a Rigaku Oxford Diffraction Synergy S with a HyPix 6000SE hybrid photon counting

detector, for the most demanding samples, and a SuperNova equipped with an Oxford Cryosystems N-Helix cryo cooling system allowing for data collection down to 25 K.

High-resolution XRD uses highly monochromatic X-rays to study individual Bragg peaks of bulk single-crystal and thin-film materials, allowing precise measurement of layer thicknesses, composition analysis and diffuse scatter measurements. Typical routine applications of high-resolution XRD include reflectivity, rocking curves and reciprocal space mapping, stress and texture measurements. A high temperature stage (up to 1100 °C) is available.

Small angle X-ray scattering

SAXS is an X-ray technique for non-destructive investigation of nanoscale particle size, distribution and morphology. Typical measurements include particle size, distribution and morphology determination, tensile strain and temperature variation measurements. Applications include polymers, nanocomposites, magnetic nanoparticles, powders, fibres, pastes, gels, liquid dispersed particles and thin-films (Grazing-Incidence SAXS).

The Xenocs Xeuss 2.0 SAXS system is equipped with dual microfocus sources; Cu for standard measurements and Mo for more absorbing samples. It has a q range of 0.025 to 30 nm⁻¹, giving a maximum measurable particle diameter up to roughly 250 nm. We have Linkam HFSX350, TS700 and TST250V stages for measurements as a function of temperature (-196 to 700 °C) and/or strain (-196 to 250 °C).

X-ray Fluorescence

A full-size Rigaku Primus IV WD XRF is available for the determination of elemental composition from B to U with a focus on light-element sensitivity. Samples can be in solid form, pellets, fused beads, loose powder, liquids or thin-films.

“The training and data analysis help we have had on the SAXS has really helped us push the boundaries of our research. In particular, Steve has been excellent at supporting our exploration of a new technique.”

**PROFESSOR SEBASTIEN PERRIER,
DEPARTMENT OF CHEMISTRY**

BIOLOGICAL SUPPORT UNIT

To see how we can help you, contact biotech4@warwick.ac.uk

Research involving animals has made, and continues to make, a vital contribution to understanding, treating and curing many major health problems. Whilst new methods have enabled scientists and medical researchers to reduce and replace experiments involving animals, some animal studies must continue for further progress in science and medicine to be made.

Cognisant of the many ethical and legal issues surrounding the use of animals in biomedical research, the University of Warwick Biological Services Unit (BSU) contributes to the advancement of biomedical research through the supply of high quality research animals and allied professional services.

 **140** individually ventilated rat cages with a total holding capacity of **420** rats

 **1150** individually ventilated mice cages with a total holding capacity of **3500** mice

Recirculating aquatic system with holding capacity of **15000** zebra fish

CAPABILITIES

- ▶ Compliance with UK and EU legislation concerning the breeding and use of animals for research
- ▶ Transgenic service licences to enable breeding and supply of genetically altered animals (rodents and fish) for research
- ▶ Antibody service licence: custom antibodies can be generated in mice
- ▶ Transportation and ordering of animals arranged on your behalf
- ▶ Breeding of animals and maintaining of colonies to meet your experimental requirements
- ▶ Licenced and competent staff to assist with procedures
- ▶ Procedure and surgical rooms available for general use.
- ▶ Containment level 2 holding facility and procedure room.

HOW DO I ACCESS THE RTPS?

USERS AT WARWICK

Each RTP has a Manager, listed below, who will be best positioned to indicate what training or services are available and the timeframe for gaining access. They will also be able to provide the latest internal costing for accessing the RTP if applicable. Once trained, many of the RTPs run online booking systems to provide users with the most convenient access possible.

EXTERNAL USERS

Access to both equipment and expertise at the University of Warwick is processed through Warwick Scientific Services (WSS), for both industry and other higher education institutions (HEIs).

WSS is a central point of contact for any enquiry, whether you need access to a specific model of instrumentation, or to discuss options around a complex problem that is outside your company's current expertise. WSS will put you in direct contact with the person with the knowledge and skills to handle your investigation and has an online portal for quick turnaround of contracting - which includes an NDA and MTA for your convenience.

To discuss access to the RTPs, or any other scientific enquiry you may have, please contact Dr Ian Hancox (i.hancox@warwick.ac.uk, 02476 1 50380).
