

Introduction to the SC RTP desktop

Part 6 - Modules

Commands are given in backticks, like ``ls``. This section assumes you are on an SC RTP desktop, a cluster machine, or a similar system which uses modules.

- List your loaded modules (``module list``). Do you have any loaded?
- List the available modules which contain the string 'math' (``module avail`` and/or ``module spider``).
- Which is the default version?
- If you have any version of mathematica loaded, unload it (``module unload mathematica``). Try loading the default Mathematica, and also version 10.0.
- If you need any modules for your work, work out the commands to load them. Try adding the load commands to your `.bashrc` file. Check this works.
