

Do you have a data project?

A set of data that you've been meaning to mine for useful information for some time?

Would you like some help?

Free?

The University of Warwick has a world leading capability in Data Science, Statistics and Business Analytics.

Our MSc students need real world projects and data.

Initially, we are running a pilot project with MSc projects in Q2 and Q3 2016, depending which course they are on.

The students will choose their project in January or February. The sooner we can publicise your proposed project the better.

The projects typically run for 10 weeks.

Send us a brief description of your proposed project and if we think it's suitable, we will ask you to write a longer description of about 1 page A4. The students choose from a pool of projects, so make sure it sounds interesting and worthwhile.

GUIDELINES

- Please ensure you have all the necessary permissions from your company to share the data with the University. We can help with confidentiality agreements and IP management. If you have a legal department, check with them, they may have different ideas on data protection.
- Ensure that the project is manageable within a 10 week period.
- The students choose their own projects, so there is no guarantee that your project will be chosen.
- This is not a data cleansing project due to the limited time. The data must already be in a suitable state and format for analysis.
- These are students, not professional data scientists. Though they will be mentored, students range in skills.
- Consider if the project is successful, if you'd like to take it further as a PhD project over several years and in much more detail – this won't be free.

If you have a piece of work larger than a 10 week MSc project, ask us for advice, we'd genuinely like to talk to you about it.
