Panaboard Panasonic UB5338C

This piece of kit allows you to scan whatever you have created on the whiteboard surface and upload it onto a SD card (p.19 of full manual), USB stick (p.18), computer device (p.21-22), or send to an external printer (pp.20-21). See full user manual.

Before beginning, always check that the device you are planning on transferring the scanned image to works with the Panaboard by sending a test scan to it.

Specific software should not be necessary for this to work so if you are having issues check the following:

- The power source for the Panaboard is plugged in and on
- The connection cable between your device and the Panaboard
- That the USB or SD card has been inserted correctly
- That your USB or SD card do not have any security features enabled

Remember that a scan is taken of any images on the board so some colours – such as light green – or very small writing can be difficult to detect or create a legible image of.
