Microlab Mobile Music Cube
Portable speakers

Front

Back
Accessories

Input cables

Power cable

USB power cable
This is a quick guide on how to connect these speakers to a laptop.

On the back of one speaker you have:

- **Input socket**

On the back of the other you have:

- **Main input socket (connects speaker direct to laptop)**
- **Volume control buttons**
- **Output socket**
- **Power (in) socket**
- **On/off switch**

The input cables have one gold coloured end and one silver.
1. Use the gold ended cable to connect the two speakers together. Plug one end into back of speaker with single output socket and the other end into L output (middle socket) on the other speaker.

2. Use the silver coloured end cable to connect the speakers to the laptop. Plug one end into the main input (top) socket and the other end into the audio (head phones) socket on the Laptop.

3. You have two options to power the speakers:
   - The mains power supply
   - The USB power cable
   It does not matter which you use but you must choose one as the speakers need power to work.

When you have connected your chosen power supply check the speakers have power, if they have, you will see a small orange light on the front on the speaker.

It is best to test they work before a session so play some music, YouTube etc. on laptop.

If you have no sound check the following:

- Your laptop is not on mute and the laptop volume is turned up
- Check all cables are pushed in correctly
- Check speaker on/off button is switched on
- Use the volume buttons on the back of speaker (+ to increase - to decrease)
- If all else fails speak to a member of the Community Engagement Team
